

**Measuring the Value of Risk Classification  
in a Dynamic Marketplace**

David Cummings  
VP & Chief Actuary  
ISO Innovative Analytics

ISO Innovative Analytics ISO

---

---

---

---

---

---

---

---

**Overview**

- Some macro indicators of economic value of risk classification
- Recognizing marketplace realities in measuring value
- A multi-year Net Present Value framework for model evaluation
- Some observations about model lift comparisons

ISO 2

---

---

---

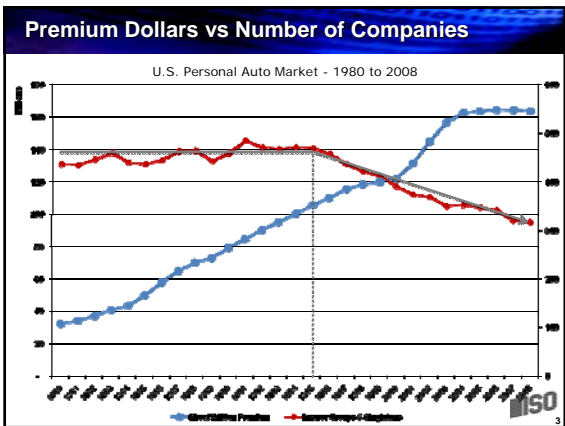

---

---

---

---

---

---

---

---

---

---

---

---

---

**How Some Actuaries Make the Case to Increase Segmentation**

We need to enhance our analytics in order to maintain our competitive pricing advantage!

I don't want to lose our pricing advantage. How much will it cost to implement an enhanced pricing strategy?

---

---

---

---

---

---

---

---

**How Some Actuaries Make the Case to Increase Segmentation**

It will cost \$10 million to modify our underwriting and agency systems.

That's a lot of money to spend! How much additional revenue will we bring in?

---

---

---

---

---

---

---

---

**How Some Actuaries Make the Case to Increase Segmentation**

We will implement the new rate structure so that it will be revenue neutral.

You want me to spend \$10 million to get NO additional revenue? That doesn't make any sense!

---

---

---

---

---

---

---

---

### How Some Actuaries Make the Case to Increase Segmentation

Why doesn't he understand how important this pricing strategy is to our business?

Where can I find an actuary with some business sense?

---

---

---

---

---

---

---

---

### Measuring the Value of Rate Segmentation

- Measuring "Lift"
- Value-based measures
- Comparing Costs to Benefits

---

---

---

---

---

---

---

---

### What do we mean by "Lift"

- Accuracy of prediction
- Relative to current prediction (sometimes)

---

---

---

---

---

---

---

---

## Measuring Lift

- **Usually involves some sort of data summarization**
  - Helps to remove noise from the data
- **Measure against a hold out data set**
  - Helps avoid overfitting the data
- **“Lift” is not the same as “Goodness of Fit”**
  - Fitting the data is not as important as predicting the mean accurately

13

---

---

---

---

---

---

---

---

## Fit vs. Lift – An Example

- **Two different class plans**
  - Continuous Model is much more accurate and shows lift over Discrete Model

- **Deviance measure improves only 0.1%**

14

---

---

---

---

---

---

---

---

## Typical Lift Measures

- **Prediction Mean Square Error**
  - Error is going to be high on individual losses, but directionally correct
- **Lift Chart “Top to Bottom” Ratio**
  - Ignores lift in the middle

15

---

---

---

---

---

---

---

---

### Gini Index

- Measures accuracy of rank ordering
- Directly considers entire range of predictions
- Can be used to compare different predictions

---

---

---

---

---

---

---

---

### Drawing the Lorenz Curve

---

---

---

---

---

---

---

---

### Drawing the Lorenz Curve

---

---

---

---

---

---

---

---

### Drawing the Lorenz Curve

---

---

---

---

---

---

---

---

### Drawing the Lorenz Curve

---

---

---

---

---

---

---

---

### Lorenz Curve and Gini Index

---

---

---

---

---

---

---

---

### More about Gini Index

- **Can perform statistical tests using Gini index**
  - Identify significant improvements in rank orderings
- **Reference:**
  - Working paper available on Jed Frees' website (University of Wisconsin)
  - "Summarizing Insurance Scores using Gini Index"

---

---

---

---

---

---

---

---

### Demonstrating Value

- **So far, all measures have dealt with statistical value**
  - Basis for model building decisions
- **Need to introduce a framework to measure economic value**
  - Basis for model implementation decisions

---

---

---

---

---

---

---

---

### How Some Actuaries Make the Case to Increase Segmentation

Why doesn't he understand how important this pricing strategy is to our business?

Where can I find an actuary with some business sense?

---

---

---

---

---

---

---

---

### What's wrong with this dialog?

- **Focus only on implementation costs**
  - In a competitive marketplace, there is a cost to doing nothing
  - Lost business, lost revenue, and increasing cost of remaining policies
- **Short-term view of revenue impact**
  - "Revenue Neutral" applies only to average premiums on current book
  - There can be long-term revenue impacts

---

---

---

---

---

---

---

---

### How to make the case better

- **Better projections of revenue and profit impacts**
  - Look beyond "Revenue Neutral" implementation
- **Better consideration of marketplace dynamics**
  - Includes customer retention and competitive effects
- **Demonstrate the value in monetary terms**

---

---

---

---

---

---

---

---

### The Discounted Cash Flow Trap

---

---

---

---

---

---

---

---

### Illustration

- Two insurers write 3 policies each
- Laggard Insurance prices all policies in same class
- Luminary Mutual uses more accurate segmentation
- Both companies have same profit provisions (10% of premium)

Reference: Cummings, "The Business Impact of Advanced Analytics", Contingencies, Nov/Dec 2009, pp 46-51.

---

---

---

---

---

### Illustration – Initial State

Laggard Insurance			Luminary Mutual		
Actual Expected Cost	Policy Premium	Profit	Actual Expected Cost	Policy Premium	Profit
\$600	\$880	\$280	\$600	\$660	\$60
\$800	\$880	\$80	\$800	\$880	\$80
\$1,000	\$880	-\$120	\$1,000	\$1,100	\$100
<b>Total</b>		<b>\$240</b>	<b>Total</b>		<b>\$240</b>

29

---

---

---

---

---

---

---

---

### Illustration – After Year 1

Laggard Insurance			Luminary Mutual		
Actual Expected Cost	Policy Premium	Profit	Actual Expected Cost	Policy Premium	Profit
\$800	\$880	\$80	\$600	\$660	\$60
\$1,000	\$880	-\$120	\$600	\$660	\$60
\$1,000	\$880	-\$120	\$800	\$880	\$80
<b>Total</b>		<b>-\$160</b>	<b>Total</b>		<b>\$200</b>

30

---

---

---

---

---

---

---

---

### Value of Lift (VoL)

- Assume a competitor comes in and takes away the above average risks.
- Because of adverse selection, the new loss ratio will be higher than the current loss ratio.
- *What is the value of avoiding this fate?*
  - \$400 in this illustration (\$240 expected profit vs. \$160 loss)
  - Insurer could have spent additional \$400 for segmentation and been no worse off
- May express the VoL as a \$ per car year.
  - \$133 per policy

---

---

---

---

---

---

---

---

### Illustration – After Year 1

Laggard Insurance			Luminary Mutual		
Actual Expected Cost	Policy Premium	Profit	Actual Expected Cost	Policy Premium	Profit
\$800	\$880	\$80	\$600	\$660	\$60
\$1,000	\$880	-\$120	\$600	\$660	\$60
\$1,000	\$880	-\$120	\$800	\$880	\$80
Total		-\$160	Total		\$200

New Policy Premium = \$1,027

---

---

---

---

---

---

---

---

### Illustration – After Year 2

Laggard Insurance			Luminary Mutual		
Actual Expected Cost	Policy Premium	Profit	Actual Expected Cost	Policy Premium	Profit
\$1,000	\$1,027	\$27	\$600	\$660	\$60
\$1,000	\$1,027	\$27	\$600	\$660	\$60
\$800	\$880	\$80	\$800	\$880	\$80
Total		\$54	Total		\$280

New Policy Premium = \$1,100

---

---

---

---

---

---

---

---

### Illustration – After Year 3

Laggard Insurance		
Actual Expected Cost	Policy Premium	Profit
\$1,000	\$1,100	\$100
<b>Total</b>		<b>\$100</b>

Luminary Mutual		
Actual Expected Cost	Policy Premium	Profit
\$600	\$660	\$60
\$600	\$660	\$60
\$800	\$880	\$80
\$800	\$880	\$80
\$1,000	\$1,100	\$100
<b>Total</b>		<b>\$380</b>

---

---

---

---

---

---

---

---

### Illustration Summary

---

---

---

---

---

---

---

---

---

---

### The Discounted Cash Flow Trap

---

---

---

---

---

---

---

---

---

---

### Calculating NPV

**Laggard Insurance  
"Do Nothing"**

Year	Profit
0	\$240
1	-\$160
2	\$54
3	\$100
<b>NPV</b>	<b>\$207</b>

**Luminary Mutual  
"Invest in Segmentation"**

Year	Profit
0	\$240
1	\$200
2	\$280
3	\$380
<b>NPV</b>	<b>\$875</b>

NPV Calculated using a 15% Discount Rate

37

---

---

---

---

---

---

---

---

---

---

### Calculating NPV – Considering Marginal Costs

**Laggard Insurance  
"Do Nothing"**

Year	Profit
0	\$240
1	-\$160
2	\$54
3	\$100
<b>NPV</b>	<b>\$207</b>

**Luminary Mutual  
"Invest in Segmentation"**

Year	Profit	Marginal Costs	Net Profit
0	\$240	\$100	\$140
1	\$200	\$20	\$180
2	\$280	\$25	\$255
3	\$380	\$25	\$355
<b>NPV</b>			<b>\$723</b>

NPV of "Status Quo" Scenario = \$788

NPV Calculated using a 15% Discount Rate

38

---

---

---

---

---

---

---

---

---

---

### Impact of Pricing Strategy

- **Assessing the value of a pricing strategy**
  - Requires understanding of marketplace dynamics
  - Requires projections of revenue, retention, and conversion effects
- **Basis of comparison is not "status quo"**
  - Project the "do nothing" scenario appropriately
