Casualty Actuaries of the Northwest: Strategies for Homeowners Profitability and Growth

Nancy Watkins, FCAS, MAAA Principal and Consulting Actuary Milliman, Inc.

September 25, 2015

Why is Homeowners so challenging?

Strategies for integrated approach to risk

Use the data you already have

Policyholder Age 1.20 **Ex-wind Loss Ratio** 1.00 0.80 Relativity 0.60 0.40 0.20 0.00 AA tO AS 10 or more 24¹⁰00 62²⁰68 60° 60° 63^{to}10 01034 39^{t0 4^A} 48 10 S2

Find new insights within company data

Use data from third party sources

Use Geographic Information Systems data

Example: Hurricane

Land Use/Land Cover

NOISE. 1. Source: National Land Cover Dataset (2006) from the United States Geological Survey.

Coastline

Effective Surface Roughness

1. Effective surface roughness length (m) estimated by Milliman using the National Land Cover Dataset (2006) from the United

Distance to Coast

Start with GIS data, such as land use/land cover and a coastline

Use these to prepare predictor variables, such as effective surface roughness and distance to coast

Use Catastrophe Model Output For Granular Pricing

Hurricane AAL / Coverage in \$1000's

Combine new predictor variables with catastrophe model output to model relationships to hurricane burn rate

Example: Storm surge

Elevation

Start with GIS data, such as elevation, coastline, stream/river locations

Use these to prepare predictor variables

Refine storm surge risk assessment

Combine with cat model output to refine underwriting rules for excessive storm surge risk, e.g. minimum permissible elevation given the distance to tidal water

Example of ineligible locations

Example: Flood

- Target variables:
- Storm surge AAL
- Inland flood AAL
- Predictor variables:
- Relative Elevation
- Distance to Mean High Water Line
- Distance to River/Stream
- (Grouped)Hydrological Unit

Pricing Flood: the Risk is Continuous

Traditional Flood Zone Rating (NFIP Flood Zones)

Continuous Flood Rating

Example: Non-Hurricane Wind Risk

- Start with Hail Days per Year
- Use to determine territorial definitions
- Then use catastrophe model output to set relativities

Examples of Non-Hurricane Wind Territories Based on this Approach

GIS Data for Other Perils

С

Example: Wildfire Risk

Some predictors of fire loss:

- Length of road
- Slope
- Area of neighborhood
- Distance to edge of neighborhood
- Housing Density
- Distance-to-coast

"Housing Arrangement and Location Determine the Likelihood of Housing Loss Due to Wildfire" (Syphard, et al.)

Example: Sinkhole

Soil permeability

Limestone

Head difference

Subsidence incident reports

Start with GIS data reflecting geological characteristics that affect sinkhole risk

Model against subsidence incidence reports to get sinkhole risk score

Use sinkhole risk score to determine ineligible locations, and combine with insurance claim data to create rates and rating territories

Know your competition

And then get to know them even better

What is Extra AOP Profit Worth?

	Census only model	With Black Knight model
Current average expected annual AOP profit	\$16	\$16
Average expected AOP loss cost	\$278	\$278
Loss Ratio Relativity of best 10%	73%	36%
Expected AOP loss cost of best 10%	\$202	\$101
Decrease in loss cost/Increase in annual profit	\$76	\$177
Expected annual profit of best 10%	\$92	\$193

Assumptions: Average AOP Premium = \$427 Expected AOP percent profit = 3.7% AOP permissible loss ratio = 65% In this scenario, the Black Knight model selects prospects with \$101 higher average profit

Put it all together

Profitability + competiveness + market size = opportunity

Talon

Improve your rate indications

- Rerate historical policies
- Split indications by peril
- Calculate a separate cost of reinsurance
 - Expected reinsurer profit = expected ceded premium less expected ceded loss and LAE
 - Allocate to company, state, program, line, form, peril, territory
- Enhance trend calculation
- Improve the complement of credibility
- Map results to see if they make sense

Take actions outside of rates

Challenges for "non-large" companies

What if you don't work for AllStateFarmers?

- Credibility
- Data availability
- Systems limitations
- In-house expertise / access to technology

Even small companies have useful data

Milliman

Quote Volume and Bind Rates Over Time

What variables correlate with bind rate?

- In other words, what dimensions should we look into more closely?
- Can include variables not used for rating, for marketing insights
- Or limit to variables used for rating, for pricing decision support

Example of Multivariate Segmentation

Get started

- Get your pricing and underwriting right
 - Split rating algorithm, at least by major peril
 - Use GIS data and cat model output to
 - Add new rating factors
 - Redo your territories
 - Get rid of misaligned discounts and rating factors
 - Leverage competitive analysis to make selections
- Get the most from your marketing
 - Develop profitability measurements to decide where to grow
 - Identify market segments where you are competitive
 - Pinpoint individual homes to pursue where you are profitable and competitive
 - Share insights and target lists with agents
