

Multi-something Regression Models

Brian A. Fannin

March 23, 2014

The loss triangle

| AY | 12 | 24 | 36 | 48 | 60 | 72 | 84 |
|------|-------|--------|--------|--------|--------|--------|--------|
| 2002 | 2,318 | 7,932 | 13,822 | 22,095 | 31,945 | 40,629 | 44,437 |
| 2003 | 1,743 | 6,240 | 12,683 | 22,892 | 34,505 | 39,320 | |
| 2004 | 2,221 | 9,898 | 25,950 | 43,439 | 52,811 | | |
| 2005 | 3,043 | 12,219 | 27,073 | 40,026 | | | |
| 2006 | 3,531 | 11,778 | 22,819 | | | | |
| 2007 | 3,529 | 11,865 | | | | | |
| 2008 | 3,409 | | | | | | |

Dimensions: two

Variables: just the one

Construction of model factors

- Diligent copying of formulae
- Use of the OFFSET function
- VBA
- Change the data

The most important 3 words in the history of the actuarial profession ever

"Abandon your triangles!"

- Dave Clark

The long format

| | A | B | C |
|----|------|-------|--------|
| 1 | AY | Month | Paid |
| 2 | 2002 | 12 | 2,318 |
| 3 | 2003 | 12 | 1,743 |
| 4 | 2004 | 12 | 2,221 |
| 5 | 2005 | 12 | 3,043 |
| 6 | 2006 | 12 | 3,531 |
| 7 | 2007 | 12 | 3,529 |
| 8 | 2008 | 12 | 3,409 |
| 9 | 2002 | 24 | 7,932 |

| 29 | 2002 | 84 | 44,437 |

Dimensions: two?
Variables: ??

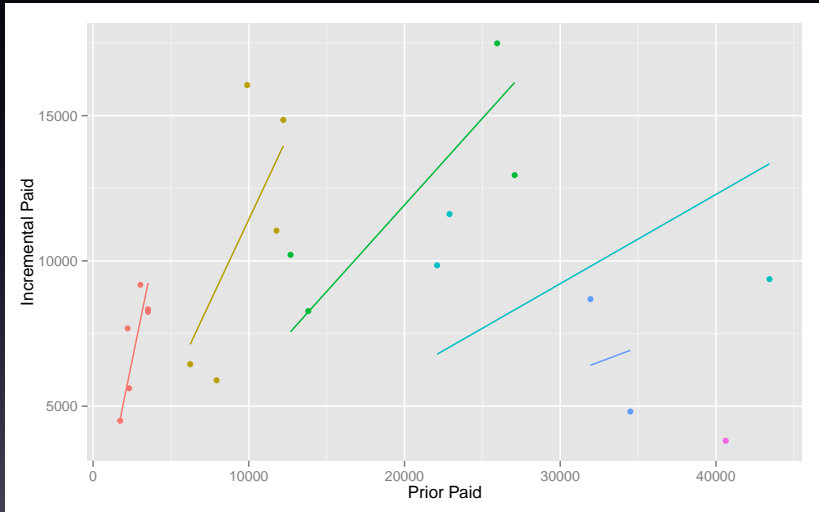

Plotting a long triangle

Grouping the plot

A plot looks like a model

Most reserving methods are linear models

$$Y = \alpha + \beta_1 X_1 + \varepsilon$$

- 1 Linear model with specified parameters
 - Significance of individual model factors
 - Significance of model
- 2 Functional form of errors
- 3 Independence of errors
 - (Serial) correlation of errors
 - Homoskedasticity

Link ratio estimates are variables

Residual plots

Loads more we could do with linear regression:

- Heteroskedasticity
- Serial correlation
- Form of error term (skewed normal?)

The long format again

| DirectEP | CededEP | NetEP | CumulativeIncurred | CumulativePaid | IncrementalIncurred | IncrementalPaid | PriorIncurred | PriorPaid | Company | Line |

Multi-dimensional vs. multivariate

- Dimensions = specification of where something happens
- Variable = what happens there

Multivariate regression

Multivariate regression is EASY.
Multi-dimensional, not so much.

Multivariate regression in reserving

This is difficult:

- Very few degrees of freedom
- Stochastic regressors
- Claim report latency

Regression

Multi-dimensional regression

$$y_i \sim N(\alpha_{j[i]} + \beta_{j[i]}x_i, \sigma_y^2)$$

$$\alpha_j \sim N(\mu_\alpha, \sigma_\alpha^2)$$

$$\beta_j \sim N(\mu_\beta, \sigma_\alpha^2)$$

12-24 Months for 92 Auto companies

Grouped

3 ways to fit multi-dimensional data

- 1 Lump all the data together - Pooled
- 2 Model each group separately - Individual
- 3 Weight both estimates together - Mixed

Pooled

$$\text{IncrementalPaid} = \alpha + \beta \text{PriorPaid} + \epsilon$$

| | Estimate | Std. Error | t value | Pr(> t) |
|-------------|----------|------------|---------|----------|
| (Intercept) | 100.6437 | 30.4961 | 3.30 | 0.0010 |
| PriorPaid | 0.9597 | 0.0095 | 100.97 | 0.0000 |

Individual

This is effectively 90 different regressions. Here are results for the first 5.

| | Estimate | Std..Error | t.value |
|-------------------------------|----------|------------|---------|
| Agway Ins Co | 0.61 | 0.91 | 0.66 |
| Alaska Nat Ins Co | 0.76 | 0.24 | 3.20 |
| Alliance Mut Ins Co | 1.75 | 10.94 | 0.16 |
| American Contractors Ins Grp | 1.22 | 1.28 | 0.95 |
| American Resources Ins Co Inc | 0.78 | 0.91 | 0.86 |
| Antilles Ins Co | 0.85 | 0.97 | 0.87 |

Multi-dimensional regression

$$\alpha_j \sim N(\mu_\alpha, \sigma_\alpha^2)$$

$$\hat{\alpha}_j \approx \frac{\frac{n_j}{\sigma_y^2} \bar{y}_j + \frac{1}{\sigma_\alpha^2} \bar{y}_{all}}{\frac{n_j}{\sigma_y^2} + \frac{1}{\sigma_\alpha^2}}$$

Mixed model fit

| | (Intercept) | PriorPaid |
|-------------------------------|-------------|-----------|
| Agway Ins Co | -20.13 | 0.88 |
| Alaska Nat Ins Co | 48.26 | 0.78 |
| Alliance Mut Ins Co | 33.62 | 0.90 |
| American Contractors Ins Grp | 75.99 | 0.90 |
| American Resources Ins Co Inc | 9.14 | 0.89 |
| Antilles Ins Co | 12.02 | 0.89 |

Model comparison

How about another predictor?

Additive method results

Model comparison

| | Multiplicative | Additive |
|------------|----------------|----------|
| Pooled | 439.90 | 362.75 |
| Individual | 262.20 | 251.07 |
| Mixed | 256.85 | 236.89 |

Thoughts

- How much data are you throwing away?
- How often do statistical diagnostics drive model decisions?
- How often does technology dictate what's in your statistical toolkit?

Thanks!
