<u>Economic Capital Modeling – Theory v. Practice</u>

James P. McNichols, Chief Actuary, Southport Lane; CEO AYA Consultants LLC

<u>Economic Capital Modeling – Theory v. Practice</u> **Presentation Overview**

- Intended for P&C actuaries.
- Emphasis on practical approaches.
- Assumes loss/exposure data is (reasonably) correct.
- Common thread will be capital modeling and the forward time horizon <u>does not exceed 1 year</u>.

<u>Economic Capital Modeling – Theory v. Practice</u> **Tabula Rasa Exercise**

What is the project?

Who is the pupil?

What is the goal?

Measure risk v Manage risk v Moving risk

3 C's (Credible/Consistent/Comprehendible)

- Book Value Relativities
- Directional Leverage Deltas
- Inflection Points Under Alternative Risk Structures

<u>Economic Capital Modeling – Theory v. Practice</u> **Financial Mathematics & Modeling Mantras**

Credibility is the prime directive.

- Bigger book is better than smaller.
- More diversity is better than less.
- More years of historical data is better than fewer.
- More alignment is better than less.
- More simulation trials in the tail does not necessarily improve predictive inferences

<u>Economic Capital Modeling – Theory v. Practice</u> **Financial Mathematics & Modeling Mantras**

Capital Charges are a function of Surplus Impairment.

CV measures are useful & analogous to Sharpe Ratios. All DRM projects are dripping with parameter risk. Physics envy exists (i.e., process risk...is what it is). There is no "loss pick" & "everyone is Bayesian". <u>Economic Capital Modeling – Theory v. Practice</u> Standard of Care Hierarchy

- 1 Deal junkies
- 2 Investment managers
- 3 Executives and lead underwriters
- 4 Board of Directors
- 5 Third party reviewers
 - Auditors
 - Regulators
 - Rating Agencies

<u>Economic Capital Modeling – Theory v. Practice</u> **P&C Insurance Company Key Risk Variables**

- 1. Premium Risk (aka U/W Risk)
- 2. Reserving Risk (e.g., Prior Years Effects)
- 3. Interest Rate Risk
- 4. Investment Risk Bonds
- 5. Investment Risk Stocks/Equities
- 6. Credit Risk Bonds
- 7. Credit Risks Reinsurance Recoveries

<u>Economic Capital Modeling – Theory v. Practice</u> **Underwriting Risk**

- Frequency & Severity PDF's
 - Best Fit does not always yield Best Selection
- Reinsurance Structural Needs/Tradeoffs
 Do not model Fac Treaty by Risk/other tradeoff
- Good Industry Benchmarks Available
- Embrace Bayesian Philosophy

<u>Economic Capital Modeling – Theory v. Practice</u> Underwriting Risk – Curve Fitting Example

Economic Capital Modeling Constraints

- 1 year forward time horizon
- 1:200 stress level events

Underwriting Risk (Example)

- Frequency
- Severity
- Aggregate claims distribution
- Stochastic (i.e., Monte Carlo) simulated outcomes
- Stress level thresholds
- Economic capital contribution

Underwriting Risk – Example (Corp WC-Only) Stochastic Simulation (aka Monte Carlo)

Underwriting Risk – Example (Corp WC-Only)

Underwriting Risk – Example (Corp WC-Only)

Economic Capital Modeling Results (U/W Risk variable only)

- Stochastic Simulation of each LOB variable at 1:200 stress

•	Work Comp - Corp	\$ 5.3 MM
•	Work Comp - Retail	2.1 MM
•	Gen Liab Corp & Retail	1.6 MM
•	Auto Liab Corp & Retail	1.0 MM
•	Auto PD - Corp & Retail	0.5 MM
•	Retail Property	2.0 MM
•	Sum	\$12.5 MM

Required Economic Capital => \$8.5 MM*

*does not equal the sum of the parts due to portfolio effects

(i.e. diversification credit)

<u>Economic Capital Modeling – Theory v. Practice</u> **Reserving Risk**

- Traditional Methods if for GAAP Balance Sheet
- Stochastic Methods if for Capital Modeling
- GLM Methods if Pro Forma Planning
- ALL Methods if for M&A
- Good Industry Benchmarks Available
- Embrace Bayesian Philosophy

<u>Economic Capital Modeling – Theory v. Practice</u> **P&C Industry (U.S.) Reserve Risk Benchmarks; CV of ULT Development of a Single Accident Year**

U.S. Industy Aggregate - AY's (1980 - 2002) NET of Reinsurance

Statistic = actual final reserve / initial reserve

Line of Business	<u>Mean</u>	<u>CV</u>
Private Passenger Auto	0.95	7%
Homeowners	0.99	9%
Commercial Auto Liability	1.06	12%
Commercial Multi-Peril	1.07	12%
Workers Compensation	1.06	17%
Products Liability	1.14	25%
General Liability	1.12	27%
Medical Professional Liability	1.03	29%

<u>Economic Capital Modeling – Theory v. Practice</u> Interest Rate Risk

- ESG approach v. Modular approach
- Practical Actuarial Alternatives

Typical model of interest rate dynamics in the form:

 $\Delta \mathbf{r}_t = \mathbf{k}(\mathbf{b} - \mathbf{r}_t) \Delta t + \sigma \mathbf{r}_t^{\gamma} \Delta \mathbf{Z}_t$

 $\gamma = 0$; Vasicek model where changes are normally distributed $\gamma = 1$; RiskMetrics model which yields lognormal distribution $\gamma = 0.5$; Cox, Ingersoll, Ross model

<u>Economic Capital Modeling – Theory v. Practice</u> Interest Rate Risk

Practical Actuarial Alternatives (continued)

- Based upon historical empirical market statistics
- Sourced from Life/Pension colleagues

<u>Economic Capital Modeling – Theory v. Practice</u> Interest Rate Risk – Summary of Results

Generic Insurance Co. Ltd - Fixed Income Portfolio Sensitivities

Rate Change	Market Value	Market Value Change	Market Value % Change	Effective Duration	Effective Convexity
300	202,843	(32,157)	-13.7%	4.56	0.20

<u>Economic Capital Modeling – Theory v. Practice</u> Investment Risk - Bonds

Equates to Interest Rate Risk Increased Credibility due to Severity certainty

<u>Economic Capital Modeling – Theory v. Practice</u> Investment Risk – Stocks/Equities

Practical actuarial approach uses McNichols/Rizzo method with CV = VIX 1990-June 2010

2007-June 2010

<u>Economic Capital Modeling – Theory v. Practice</u> Stochastic Modeling of Market Prices

<u>Economic Capital Modeling – Theory v. Practice</u>

Generic Insurance Co. Ltd, 1 year Stock Return Projection

<u>Economic Capital Modeling – Theory v. Practice</u> Credit Risk - Bonds

- Liquidity("L") & Contagion("C") Exposure
- Rating agency transitions matrices
- Other time accelerative approaches
- Recognize L&C induce leptokurtosis
- Copula inference below 95th (Newtonian Physics)
- 95th to 99th, L or C (Special Relativity Physics)
- Beyond 99th, L <u>and</u> C (Quantum Physics)
- Conclusion: Mimic ESG or BCAR to keep pace

<u>Economic Capital Modeling – Theory v. Practice</u> Credit Risk – Reinsurance Recoverable

- Not a material concern in general (due to the lower financial leverage of Insurers v. Banks).
- Property Cat and Commercial Excess effects.
- Copula considerations (where in the CDF does the credibility need to be the highest).
- Conclusion: Mimic BCAR to keep pace.

<u>Economic Capital Modeling – Theory v. Practice</u> Dependence & Correlation Structures

<u>Economic Capital Modeling – Theory v. Practice</u> A Corollary to the Dilbert Principle

• <u>Economic Capital Modeling – Theory v. Practice</u> Correlation Does Not Imply Causation

Correlation Assumptions are extremely difficult to parameterize

•

•

•

- Correlation not constant... Risks tend to become more correlated in extreme events
- Requires ability to test sensitivity to alternative correlation assumptions

<u>Economic Capital Modeling – Theory v. Practice</u> **Dependence & Correlation Structures**

Modular Method Boundaries

Show Dependent Results (r = 1)

Then Show Independent Results (r = 0)

<u>Economic Capital Modeling – Theory v. Practice</u> **Dependence & Correlation Structures Modular Method Risk Adjustment Simplified**

Fully Dependent (Minimal ROC)Fully Independent (Excess ROC)

Then take the <u>Geometric Mean</u> Cap @D^0.5 x Cap @I^0.5 = Risk Adjusted <u>Economic Capital Modeling – Theory v. Practice</u> Fundamental Guidelines

True Capital Requirement? Optimum Leverage?

TVar v Var

1 year forward only (Sugihara & May paper)

Manage for risk and not for risk charges

KEEP YOUR BALANCE SHEET CURRENT!

Show deterministic at 98th and 99th to help visualize

<u>Economic Capital Modeling – Theory v. Practice</u> Fundamental Guidelines

Make the pupil understand the difference between:

Process Risk (the estimator of the range) versus Parameter Risk (the range of the estimator)

<u>Economic Capital Modeling – Theory v. Practice</u> Fundamental Guidelines

If you have determined an inflection point. "Speak up" and get it to be <u>known;</u> Reserve Risks exceeds Premium Risks More Stock Mutual Funds then Stocks More Derivatives Volume than Issuance

XL Capital: Claims Made v Occurrence Profile

Note to Self: Average Home Prices can decrease!
