So Many Methods, So Little Time

<p>Paid Chain Ladder, Bornhuetter-Ferguson, Backwards Recursive, Munich Chain Ladder...</p>	<p>Claims Closure, Hindsight Outstanding, Frequency Severity, Benktander...</p>
--	--

2

Overview

- § Scope of Review
- § The Methods
- § The Metric
- § Results
 - Development Age
 - Line of Business
 - Company Size
- § Correlation
- § Conclusions

3

SCOPE OF REVIEW

4 

Scope of Review

- § 3,110 Companies
- § 16 Lines of Business
- § 14 Evaluations (Excluding 2010)
- § 30 Methods

§ Hindsight Indications

- 20.9 Million In Theory
- 4.9 Million In Fact

5 

THE METHODS

6 

Methods – Chain Ladder

- § Standard Chain Ladder
 - § Paid
 - § Incurred
 - § Case Reserve
- § Berquist-Sherman (Case Adjustment)
- § Munich Chain Ladder
 - § Paid
 - § Incurred

7 

Methods – Incremental

- § Incremental Additive
 - § Paid
 - § Incurred
 - § (Normalized using net earned premium)
- § Incremental Multiplicative
 - § Paid (paid on prior paid)
 - § Incurred (incurred on prior incurred)
- § Backward Recursive
 - § Paid on prior case / case on prior case

8 

Methods – Least Squares

- § Brosius
 - § Paid
 - § Incurred
- § Weighted Brosius
 - § Paid
 - § Incurred

9 

Methods – Count-Based

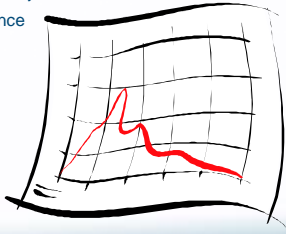

- § Frequency / Severity
- § Hindsight Outstanding – Unpaid
 - § Average unpaid loss per yet to close claim
- § Hindsight Outstanding – IBNR
 - Average IBNR loss per yet to close claim
- § Claims Closure
 - § Projection of claims to close by development period
 - § Paid loss per yet-to-close claim

10 

Methods – Loss Ratio

- § Industry-Based
 - § AM Best projections of accident year loss ratios
- § Based on Company Experience
 - § All prior years
 - § Three prior years

11 

Methods – Composite

- § Bornhuetter-Ferguson
 - § Industry loss ratio
 - § Paid
 - § Incurred
 - § Method-based prior years' loss ratio
 - § Paid
 - § Incurred
- § Benktander
 - § Paid
 - § Incurred
- § Cape Cod
 - § Paid
 - § Incurred

12 

THE METRIC

13

The Metric: "Method Skill"

§ Error = Indicated Unpaid Ratio to Premium
 – Hindsight (HS) Unpaid Ratio to Premium

§ Anomaly = Hindsight Unpaid Ratio to Premium
 – Wtd Avg HS Unpaid Ratio to Premium

§ Weighted average is across accident/report years

§ Observations:

- Anomaly is a property of the data
- Error is a property of the method

14

Method Skill

§ Skill = $1 - \frac{\text{Mean Squared Error}}{\text{Mean Squared Anomaly}}$

§ Mean is measured across accident/report years

§ Observations:

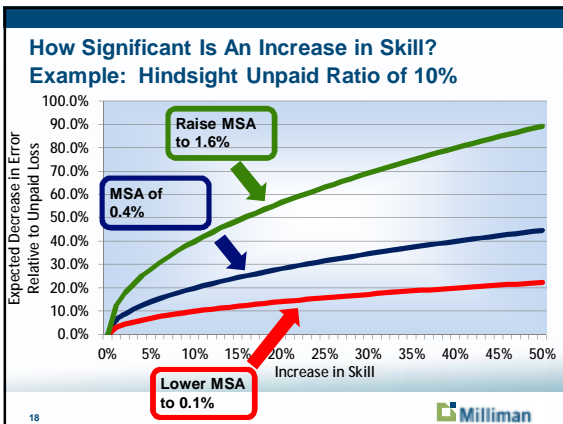

- Maximum Skill = 1
- No minimum
- It's all relative

15

THE RESULTS

19 

Results

§ Development Age
– Months of Development 12 through 108

§ Line of Business
– All Schedule P lines

§ Company Size
– Small (\$4.2M avg 2010 net annual premium)
– Medium (\$17.5M avg premium)
– Large (\$350M avg premium)

20 

**Best Performers
Mature Evaluations**

1. Hindsight IBNR
2. Backward Recursive
3. Incremental Additive – Incurred
4. Bornhuetter-Ferguson – Incurred (Industry Loss Ratio)
5. Case Reserve Chain Ladder

21 

**Best Performers
Early Evaluations**

1. Bornhuetter-Ferguson – Incurred (Industry Loss Ratio)
2. Benktander – Incurred
3. Incremental Additive – Incurred
4. Cape Cod – Incurred
5. Bornhuetter-Ferguson – Incurred (Prior Years' Loss Ratio)

22

**Worst Performers
Mature Evaluations**

30. Frequency / Severity
27. Loss Ratio (All Three Versions)
25. Weighted Brosius – Paid & Incurred
23. Brosius – Paid & Incurred
22. Incremental Multiplicative – Paid

23

**Worst Performers
Early Evaluations**

30. Frequency / Severity
27. Loss Ratio (All Three Versions)
25. Weighted Brosius – Paid & Incurred
24. Claims Closure
23. Incremental Multiplicative – Paid

24

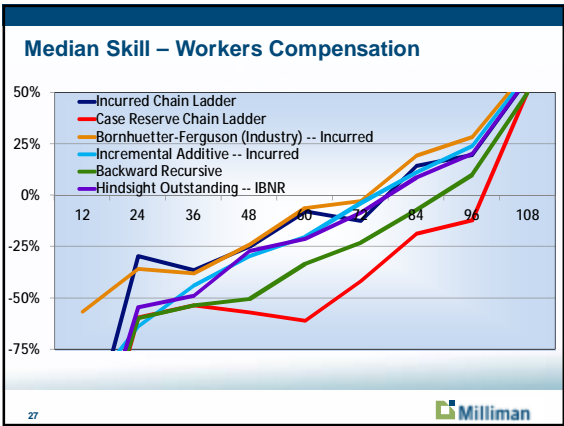

Observations on the Best Performers

- § Rely at least in part on case reserves
- § Paid does not directly impact unpaid
 - (Small impact in Benktander and Cape Cod)
- § Only one in common use
 - Bornhuetter-Ferguson

25 

Initial Conclusion

§ Several methods outperform incurred chain ladder:

- Bornhuetter-Ferguson – Incurred
- Benktander – Incurred
- Backward Recursive
- Case Reserve Chain Ladder
- Hindsight Outstanding – IBNR
- Incremental Additive – Incurred

§ So should we be using these methods?

- How applicable are the results?
- Do we really need all of these methods?

29

CORRELATION

30

Median Skill – All Lines of Business Logarithmic Scale

Correlation – Observations

- § The less correlated two methods are, the greater the skill of an average of those methods
- § Ideal weighting will depend on
 - Correlation
 - Individual method skill
- § Also important: lack of bias in methods

Average of Paid / Incurred Chain Ladders Median Skill – All Lines of Business

CONCLUSIONS

35

Conclusion #1: Consider Different Methods

36

Conclusion # 2: Consider Different Weights
