

How Reasonable is Your Range?
Exploring Relationships of Uncertainty among Estimates of Ultimate and Unpaid Claims

Casualty Actuarial Society
 Fall 2013 Meeting

Minneapolis, Minnesota

Antitrust Notice

- The Casualty Actuarial Society is committed to adhering strictly to the letter and spirit of the antitrust laws. Seminars conducted under the auspices of the CAS are designed solely to provide a forum for the expression of various points of view on topics described in the programs or agendas for such meetings.
- Under no circumstances shall CAS seminars be used as a means for competing companies or firms to reach any understanding – expressed or implied – that restricts competition or in any way impairs the ability of members to exercise independent business judgment regarding matters affecting competition.
- It is the responsibility of all seminar participants to be aware of antitrust regulations, to prevent any written or verbal discussions that appear to violate these laws, and to adhere in every respect to the CAS antitrust compliance policy.

Outline for our Discussion

- A Framework for Thinking about Ranges
- Illustrations
- Validating the Framework
- Examples
- Take-Away's

 Slide 5

Ranges of Estimates

- We're talking about ranges of estimates that are considered reasonable.
 - Based on data and information available at a point in time for the analysis of estimated ultimates and the associated unpaid amounts.
- We're **not** talking about distributions of possible outcomes.

 Slide 6

Question

For a typical book of **Personal Auto Liability** business . . .
. . . what is your view for a **range of reasonable estimates of the reserves?**

Slide 7

Question

What is your view for a **range of reasonable estimates of the reserves . . .**
. . . for **Homeowners Multi-Peril?**

Slide 8

A Framework for Thinking about It

Consider the uncertainty associated with the estimate of ultimate loss.

Then, consider the implications of that in the relation to the portion of ultimate loss that is unpaid.

And then, how does your uncertainty decrease as the exposure period matures over time?

Slide 9

Illustration
Reduce the Uncertainty

| Years Since Inception | Reasonability Metrics | | | | | | | |
|-----------------------|-----------------------|----------------|--------------|--------------|--------------|--------|-----------|--|
| | Ultimate Loss | Paid to Date % | Paid to Date | Loss Reserve | % of Premium | Amount | % Reserve | |
| | (2) | (3) | (4) | (5) | (6) | (7) | (8) | |
| 1 | 75 | 65% | 49 | 26 | 2.0% | 2 | 8% | |
| 2 | 75 | 85% | 64 | 11 | 1.3% | 1 | 12% | |
| 3 | 75 | 90% | 68 | 8 | 0.9% | 1 | 12% | |
| 4 | 75 | 95% | 71 | 4 | 0.6% | 1 | 16% | |
| 5 | 75 | 100% | 75 | 0 | 0.0% | 0 | | |
| Sum | 375 | | 326 | 49 | | 5 | 10% | |

 Slide 13

Illustration
Pick Current Year within 1% to get 5% reserve range

| Years Since Inception | Reasonability Metrics | | | | | | | |
|-----------------------|-----------------------|----------------|--------------|--------------|--------------|--------|-----------|--|
| | Ultimate Loss | Paid to Date % | Paid to Date | Loss Reserve | % of Premium | Amount | % Reserve | |
| | (2) | (3) | (4) | (5) | (6) | (7) | (8) | |
| 1 | 75 | 65% | 49 | 26 | 1.0% | 1 | 4% | |
| 2 | 75 | 85% | 64 | 11 | 0.7% | 1 | 6% | |
| 3 | 75 | 90% | 68 | 8 | 0.4% | 0 | 6% | |
| 4 | 75 | 95% | 71 | 4 | 0.3% | 0 | 8% | |
| 5 | 75 | 100% | 75 | 0 | 0.0% | 0 | | |
| Sum | 375 | | 326 | 49 | | 2 | 5% | |

 Slide 14

Validating the Framework
(Our Laboratory Experiment)

Forming a view on each of the parameters:

- Degree of certainty for the current year loss pick
- Pattern of decrease in uncertainty (decrease in estimation risk, or increase in confidence) as the exposure period matures

What attributes of the book of business or elements of the reserve analysis would be part of your considerations?

 Slide 15

Degree of Certainty for the Current Year Considerations

- Volume
- Homogeneity
- Expected payment & reporting patterns
- Claims operations (e.g., claims settlement, case reserving)
- Underwriting operations (e.g., classes, pricing, limits, deductibles)
- Current year “shock” losses (e.g., cats)

What else may be part of your considerations?

Slide 16

Degree of Certainty for the Current Year Testing Approach

- Gather Schedule P data from 10 companies for 3 lines
- Apply loss development with the Thomas Mack technique for evaluating the estimated standard error (ESE) of the ultimate loss estimate
- Blend the indications of the ESE from paid and reported development data
- Assume that the confidence in the current year pick is approximated by 1 ESE.
 - ❖ See the Walker & Littmann paper & presentation on the topic of reasonable ranges and distributions of outcomes.

There is no right answer to this question.

Slide 17

Testing – Personal Auto Liability Estimated Standard Errors at Current Year-end

Slide 18

- How does Uncertainty Decrease as the Exposure Period Matures?**
- Pro-rata as to time until last claim is paid?
 - As unreported claim counts decrease?
 - As unreported losses decrease?
 - As unpaid losses decrease?
 - As a combination of case reserves and IBNR?
 - Something else?
- Slide 21

Hypothesis:
Uncertainty decreases as the portion of unpaid or unreported losses decreases

| Years Since Inception | Paid to Date % | | Unpaid % | | Reported to Date % | | Unreported % | |
|-----------------------|----------------|-----|----------|-----|--------------------|-----|--------------|-----|
| | (1) | (2) | (1) | (2) | (1) | (2) | (1) | (2) |
| 1 | | | | | | | | |
| 2 | 44% | 56% | 73% | 27% | 73% | 27% | 11% | 11% |
| 3 | 73% | 27% | 89% | 11% | 89% | 11% | 6% | 6% |
| 4 | 85% | 15% | 94% | 6% | 94% | 6% | 3% | 3% |
| 5 | 92% | 8% | 97% | 3% | 97% | 3% | 2% | 2% |
| 6 | 96% | 4% | 98% | 2% | 98% | 2% | 1% | 1% |
| 7 | 98% | 2% | 99% | 1% | 99% | 1% | 1% | 1% |
| 8 | 99% | 1% | 99% | 1% | 100% | 0% | 0% | 0% |
| 9 | 99% | 1% | 100% | 0% | 100% | 0% | 0% | 0% |
| 10 | 100% | 0% | 100% | 0% | 100% | 0% | 0% | 0% |

Payment and reporting patterns based on industry personal auto liability data.

pwc Slide 22

Hypothesis:
Uncertainty decreases as a combination of IBNR and Case Reserves decreases

| Years since Inception | Unpaid % | 100% Case % | | 50% Case % | |
|-----------------------|----------|--------------|--------|------------|----------|
| | | Unreported % | Case % | Combined | Combined |
| 1 | 56% | 27% | 29% | 42% | 42% |
| 2 | 27% | 11% | 16% | 19% | 19% |
| 3 | 15% | 6% | 9% | 11% | 11% |
| 4 | 8% | 3% | 5% | 6% | 6% |
| 5 | 4% | 2% | 2% | 3% | 3% |
| 6 | 2% | 1% | 1% | 1% | 1% |
| 7 | 1% | 1% | 1% | 1% | 1% |
| 8 | 1% | 0% | 0% | 1% | 1% |
| 9 | 1% | 0% | 0% | 0% | 0% |
| 10 | 0% | 0% | 0% | 0% | 0% |

Illustration based on industry personal auto liability data.

pwc Slide 23

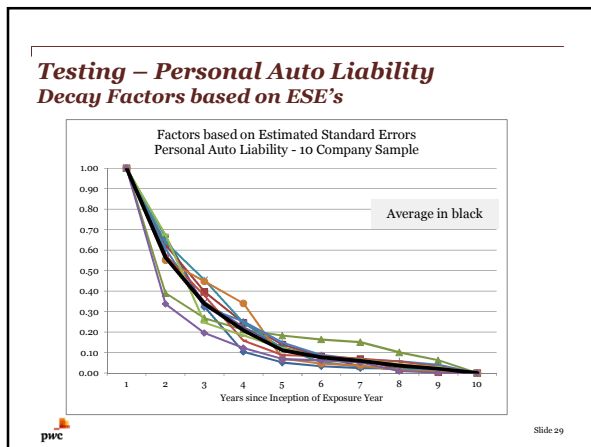

How does Uncertainty Decrease?
Testing Approach

- Gather Schedule P development histories for 10 companies for 3 lines
- Evaluate baseline loss payment and reporting patterns
- Apply the technique described by Dr. Thomas Mack for evaluating estimated standard errors (ESE's) of the ultimate loss estimates
- Observe the reduction (decay) in the ESE's as the exposure periods mature

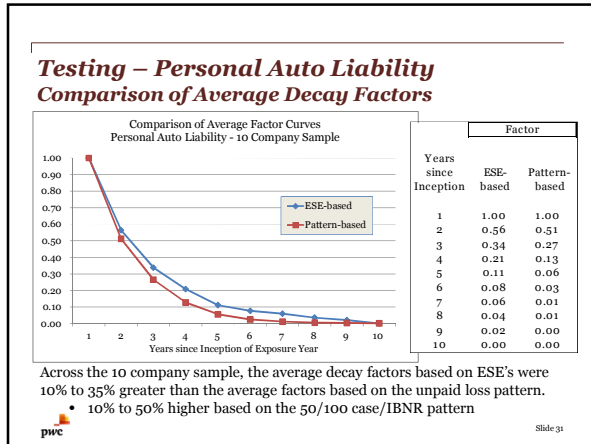

There is no right answer to this question.

pwc Slide 24

Testing – Homeowners Comparison of Average Decay Factors

Across the 10 company sample, the average decay factors based on ESE's were 0% to 80% greater than the average factors based on the unpaid loss pattern.

- Relationships based on the 50/100 case/IBNR pattern were more volatile.

Slide 34

Testing – GL-Occurrence Decay Factors based on ESE's

Slide 35

Testing – GL-Occurrence Decay Factors based on Unpaid Loss Patterns

Slide 36

Testing – GL-Occurrence Comparison of Average Decay Factors

| Years since Inception | Factor | |
|-----------------------|-----------|---------------|
| | ESE-based | Pattern-based |
| 1 | 1.00 | 1.00 |
| 2 | 0.61 | 0.83 |
| 3 | 0.40 | 0.61 |
| 4 | 0.25 | 0.41 |
| 5 | 0.19 | 0.26 |
| 6 | 0.14 | 0.16 |
| 7 | 0.08 | 0.10 |
| 8 | 0.05 | 0.06 |
| 9 | 0.03 | 0.03 |
| 10 | - | 0.01 |

Across the 10 company sample, the average decay factors based on ESE's were 15% less than to 5% greater than the average factors based on the unpaid loss pattern.

pwc Slide 37

Testing – GL-Occurrence Comparison of Average Decay Factors

| Years since Inception | Factor | |
|-----------------------|-----------|---------------|
| | ESE-based | Pattern-based |
| 1 | 1.00 | 1.00 |
| 2 | 0.61 | 0.69 |
| 3 | 0.40 | 0.46 |
| 4 | 0.25 | 0.29 |
| 5 | 0.19 | 0.18 |
| 6 | 0.14 | 0.12 |
| 7 | 0.08 | 0.08 |
| 8 | 0.05 | 0.04 |
| 9 | 0.03 | 0.02 |
| 10 | - | - |

Across the 10 company sample, the average decay factors based on ESE's were 10% less than to 10% greater than the average factors based on the IBNR loss pattern.

pwc Slide 38

Testing – Observations

What have we observed about the degree of certainty (range of uncertainty) associated with the estimate for the current exposure period?

- For some lines, the ESE may be a reasonable indicator for the uncertainty associated with the current period's estimate.
- For other lines, it may not be; in these cases, sensitivity testing may yield better indications.
- The characteristics and conditions noted previously (reference slide 16) need to be considered in forming a view.

pwc Slide 39

Testing – Observations

What have we observed about how the estimation risk decreases as the exposure period matures?

- Of the 3 development-based patterns (unpaid, unreported, and combined outstanding), the unpaid loss pattern drove the slowest reduction in uncertainty.
- For personal auto liability and homeowners, the average decay factors based on ESE's tended to be greater than the average factors based on the unpaid loss patterns.
- For GL-occurrence, the average decay factors based on ESE's tended to be less than the average factors based on the unpaid loss patterns, but were generally closer to the average factors based on the IBNR patterns.

Slide 40

Testing – Observations

What about correlations among exposure periods?

- The Mack-based calculations assume a degree of independence among the exposure periods, so that the total ESE for all periods combined is less than the sum of the ESE's for each period.
 - The overall ESE tended to be 50% to 70% of the sum of the ESE's.
- For personal auto liability and homeowners, the average decay factors based on ESE's tended to be greater than the average factors based on the unpaid loss pattern.
 - 10% to 35% higher for Personal Auto Liability
 - 0% to 80% higher for Homeowners

Considering these "features" and for ease of calculations, we continue with examples based on reduction in uncertainty based on unpaid loss patterns and summing the periods' amounts.

Slide 41

Back to our Framework

- Degree of certainty for the current year loss pick
- Pattern of increase in certainty (decrease in estimation risk) as the exposure period matures

| Years Since Inception | Reasonability Metrics | | | | | | | |
|-----------------------|-----------------------|---------------|----------------|--------------|--------------|--------------|--------|-----------|
| | Premium | Ultimate Loss | Paid to Date % | Paid to Date | Loss Reserve | % of Premium | Amount | % Reserve |
| (1) | (2) | (3) | (4) | (5) | (6) | (7) | (8) | |
| 1 | 100 | 75 | 65% | 49 | 26 | 3.0% | 3 | 11% |
| 2 | 100 | 75 | 85% | 64 | 11 | 2.0% | 2 | 18% |
| 3 | 100 | 75 | 90% | 68 | 8 | 1.3% | 1 | 18% |
| 4 | 100 | 75 | 95% | 71 | 4 | 0.9% | 1 | 24% |
| 5 | 100 | 75 | 100% | 75 | 0 | 0.0% | 0 | |
| Sum | 500 | 375 | | 326 | 49 | | 7 | 15% |

Slide 42

Industry Data – Personal Auto Liability

- Using historical industry data for premiums, ultimate losses, and loss payments
- 3% certainty for the current year
- Uncertainty decreases over time based on unpaid loss pattern

| Reasonability Metrics | | | | | | | | |
|-----------------------|---------|---------------|----------------|--------------|--------------|--------------|--------|-----------|
| Years Since Inception | Premium | Ultimate Loss | Paid to Date % | Paid to Date | Loss Reserve | % of Premium | Amount | % Reserve |
| (1) | (2) | (3) | (4) | (5) | (6) | (7) | (8) | (8) |
| 1 | 102 | 84 | 44% | 37 | 47 | 3.0% | 3 | 6.5% |
| 2 | 99 | 80 | 73% | 58 | 22 | 1.5% | 1 | 6.6% |
| 3 | 96 | 78 | 85% | 66 | 12 | 0.8% | 1 | 6.6% |
| 4 | 94 | 76 | 92% | 69 | 6 | 0.4% | 0 | 6.7% |
| 5 | 94 | 72 | 96% | 69 | 3 | 0.2% | 0 | 7.0% |
| Total | | | | | 93 | | 6 | 6.6% |

Slide 43

Industry Data – Homeowners

- Using historical industry data for premiums, ultimate losses, and loss payments
- 3% certainty for the current year
- Uncertainty decreases over time based on unpaid loss pattern

| Reasonability Metrics | | | | | | | | |
|-----------------------|---------|---------------|----------------|--------------|--------------|--------------|--------|-----------|
| Years Since Inception | Premium | Ultimate Loss | Paid to Date % | Paid to Date | Loss Reserve | % of Premium | Amount | % Reserve |
| (1) | (2) | (3) | (4) | (5) | (6) | (7) | (8) | (8) |
| 1 | 68 | 52 | 71% | 37 | 15 | 3.0% | 2 | 13.4% |
| 2 | 65 | 60 | 94% | 57 | 4 | 0.6% | 0 | 11.2% |
| 3 | 62 | 47 | 96% | 45 | 2 | 0.4% | 0 | 13.6% |
| 4 | 59 | 45 | 98% | 44 | 1 | 0.2% | 0 | 13.4% |
| 5 | 59 | 50 | 99% | 50 | 1 | 0.1% | 0 | 12.1% |
| Total | | | | | 23 | | 3 | 13.1% |

Slide 44

So, What does it Take to have a Reserves Range of plus/minus 5%?

| Line | Current Year Range (% Premium) |
|-------------------------|--------------------------------|
| Homeowners | 1% |
| Personal Auto Liability | 2% |
| GL – Occurrence * | 3% |

- Using historical industry data for premiums, ultimate losses, and loss payments
- Assuming uncertainty decreases over time based on unpaid loss pattern

* Using the IBNR loss pattern for GL-Occurrence, a 3% current year (loss ratio) range would drive a reserve range of 4%.

Slide 45

So, What does it Take to have a Reserves Range of plus/minus 5%?

| Line | Current Year Range (% Premium) |
|---------------------------|--------------------------------|
| Homeowners | 1% |
| Personal Auto Liability | 2% |
| GL - Occurrence | 3% |
| Commercial Auto Liability | 3% |
| Commercial Multi-Peril | 2% |
| Workers Compensation | 3% |

- Using historical industry data for premiums, ultimate losses, and loss payments
- Assuming uncertainty decreases over time based on unpaid losses

 Slide 46

Take-Away's

- Expressions of reasonable reserve ranges may not reflect due consideration of the ability to estimate the current year ultimate loss and how the uncertainty decreases as exposure periods mature.
- While short-tail lines may have greater certainty of the ultimate loss estimate as compared to long-tail lines, the uncertainty in relation of the unpaid losses may be greater for short-tail lines.
- Know your portfolio before making a judgment on reasonable ranges – whether on an ultimate basis or a reserve basis.
- Translating your reserve range in terms of your certainty of the current year pick and how the uncertainty decreases as loss periods mature may be useful for the variety of stakeholders who seek insights and opinions from you on your point-estimates and the associated reasonable range.
