Where to Find Data Scientists for Your Insurance Company

Insurance companies will need Data Scientists to stay competitive and

Actuaries are their best (maybe only viable) hope

Data Science in Insurance

*Why it's more important
now than ever before*

Data is everywhere and Data Science generates value from data

“Data is an emerging asset class” – World Economic Forum

“90% of the data in the world today has been created in the last two years alone”

Absolutely insane amount of computation power

Increasingly inexpensive and smart storage & computational environment

1982 Osborne PC weighs 100 times as much, has 500 times the volume, costs 10 times as much – with 1/100 of processing speed, 1/100000 memory of a typical 2010 smart phone.

Next generation tools, platforms, and approaches to data science

Traditional Approach

- Ivy league approach - only for the chosen ones
- Focused on activities - detached from outcomes
- Assumption based: model selection is based on modeler's understanding of the world?
- Development is costly and limited
- Heavy dependence on programming

Modern Approach

open source
programming

social network of
coders

automated
solutions

- Common man approach - for everyone
- Focused on business outcome
- Validation based: model selected if it predicts well in real world
- Development is crowd sourced, peer reviewed
- Automated solutions

Modern Approach

open source
programming

social network of
coders

automated
solutions

- Common man approach - for everyone
- Focused on business outcome

Predict expected fire losses for insurance policies

A Fortune 100 company, Liberty Mutual Insurance has provided a wide range of insurance products and services designed to meet our customers' ever-changing needs for over 100 years.

Within the business insurance industry, fire losses account for a significant portion of total property losses. High severity and low frequency, fire losses are inherently volatile, which makes modeling them difficult. In this challenge, your task is to predict the target, a transformed ratio of loss to total insured value, using the provided information. This will enable more accurate identification of each policyholder's risk exposure and the ability to tailor the insurance coverage for their specific operation.

Because we seek to tap innovation both inside and outside the company, certain eligible Liberty Mutual employees are encouraged to participate in this challenge for development purposes. Refer to the competition rules for the full details.

A key part of insurance is charging each customer the appropriate price for the risk they represent.

Risk varies widely from customer to customer, and a deep understanding of different risk factors helps predict the likelihood and cost of insurance claims. The goal of this competition is to better predict Bodily Injury Liability Insurance claim payments based on the characteristics of the insured customer's vehicle.

Many factors contribute to the frequency and severity of car accidents including how, where and under what conditions people drive, as well as what they are driving.

Bodily Injury Liability Insurance covers other people's bodily injury or death for which the insured is responsible. **The goal of this competition is to predict Bodily Injury Liability Insurance claim payments based on the characteristics of the insured's vehicle.**

Competition Details » [Get the Data](#) » [Make a submission](#)

Predict a purchased policy based on transaction history

As a customer shops an insurance policy, he/she will receive a number of quotes with different coverage options before purchasing a plan. This is represented in this challenge as a series of rows that include a customer ID, information about the customer, information about the quoted policy, and the cost. Your task is to predict the purchased coverage options using a limited subset of the total interaction history. If the eventual purchase can be predicted sooner in the shopping window, the quoting process is shortened and the issuer is less likely to lose the customer's business.

Using a customer's shopping history, can you predict what policy they will end up choosing?

Competition Details » [Get the Data](#) » [Make a submission](#)

Which customers will purchase a quoted insurance plan?

Before asking someone on a date or skydiving, it's important to know your likelihood of success. The same goes for quoting home insurance prices to a potential customer. Homesite, a leading provider of homeowners insurance, does not currently have a dynamic conversion rate model that can give them confidence a quoted price will lead to a purchase.

Using an anonymized database of information on customer and sales activity, including property and coverage information, Homesite is challenging you to predict which customers will purchase a given quote. Accurately predicting conversion would help Homesite better understand the impact of proposed pricing changes and maintain an ideal portfolio of customer segments.

This competition is private-entry. You can view but not participate.

Predict which customers will leave an insurance company in the next 12 months.

Understanding customer loyalty is an important part of any business. The ability to predict ahead of time when a customer is likely to churn can enable early intervention processes to be put in place, and ultimately a reduction in customer churn. This competition seeks a solution for predicting which current customers of an insurance company will leave in 12 months time, and when.

This competition is now closed to new entrants.

Started: 7:59 pm, Tuesday 22 October 2013 UTC

Ended: 11:59 pm, Saturday 21 December 2013 UTC (60 total days)

What actuaries **DON'T** need to know

Mechanics underlying complex tools, platforms and algorithms

This slide features a diagram of a neural network with multiple layers of nodes. The nodes are represented by small circles, and they are connected by lines representing weights. The diagram is presented in a clean, technical style with a white background and blue accents.

A pragmatic approach for practitioners
Learning Data Science with **automated platform** and with **business outcome** in focus

This slide contains two side-by-side bar charts. The left chart has a blue bar and a red bar, with a red arrow pointing upwards. The right chart has a green bar and a blue bar. The charts are simple and focus on comparing two data points.

Once you are familiar with real world experience & practical knowledge—
Take advantage of free educational resources out there

This slide displays logos for three educational platforms: Coursera (orange square), edX (green square), and FutureLearn (yellow square). The logos are arranged in a grid-like fashion.

Call to action
Take the unicorn by the horn

This slide features a red unicorn logo, which is a stylized unicorn head in profile. The logo is simple and uses a solid red color.

Mechanics underlying complex tools, platforms and algorithms

We use complex, automated tools successfully everyday to make our life simple and productive
 ... without knowing the mechanics.

Complex mechanics of Data Science ...

No need to learn programming to get started

Quiz # 3

Complex mechanics of Data Science ...

Additive Training

- How do we decide which f to add?
 - Optimize the objective!

- The prediction at round t is $\hat{y}_t^{(t)} = \hat{y}_t^{(t-1)} + f_t(x_t)$

This is what we need to decide in round t

$$Obj_t^{(t)} = \sum_{i=1}^n l(y_i, \hat{y}_t^{(t)}) + \sum_{i=1}^t \Omega(f_i)$$

$$\approx \sum_{i=1}^n l(y_i, \hat{y}_t^{(t-1)} + f_t(x_i)) + \Omega(f_t) + \text{constant}$$

Goal: find f_t to minimize this

- Consider square loss

$$Obj_t^{(t)} = \sum_{i=1}^n l(y_i - (\hat{y}_t^{(t-1)} + f_t(x_i)))^2 + \Omega(f_t) + \text{const}$$

$$\approx \sum_{i=1}^n l(2(\hat{y}_t^{(t-1)} - y_i)f_t(x_i) + f_t(x_i)^2) + \Omega(f_t) + \text{const}$$

This is usually called residual from previous round

Chen, Hsieh, Taylor, Guestrin

Lemma 4.1. Let $\sum_{i=1}^n l(y_i, x_i) = \beta$. Then $\sum_{i=1}^n l(y_i, x_i) \leq \beta$ and $\sum_{i=1}^n l(y_i, x_i) \geq \beta - \beta \epsilon$. Proof: Let $H_t = \beta(1 - \epsilon)^t$. We have proved Theorem 4.1.

The calculation of ϵ can be performed using dynamic programming. To simplify the algorithm slightly, let us define an auxiliary quantity ϵ_t :

$$\epsilon_t = \beta \sum_{i=1}^n \prod_{s=1}^t \Omega(x_s + 1) \quad (6)$$

We can rephrase ϵ^t in Theorem 4.1 in terms of ϵ_t , where the index t indicates $\epsilon_t = \epsilon(x_t + 1)$, so

$$\epsilon^t(x_t) = \beta(1 + \sum_{i=1}^t \epsilon_i)$$

Similarly for ϵ^t in Theorem 4.2, where the index t indicates $\epsilon_t = \beta(1 + \sum_{i=1}^t \epsilon_i)$, we have

$$\epsilon^t(x_t) = \beta(1 + \sum_{i=1}^t \epsilon_i + \sum_{i=1}^t \epsilon_i \epsilon_{i+1})$$

The calculation of ϵ can be done efficiently using a dynamic programming algorithm with the following tables:

$$\epsilon_t = \beta \sum_{i=1}^n (1 + \sum_{s=1}^t \epsilon_s) \quad (7)$$

In the case of linear chain CRFs, each problem is reduced to the calculation of $\epsilon_t = \beta \sum_{i=1}^n \prod_{s=1}^t \Omega(x_s + 1)$ and $\epsilon_t = \beta \sum_{i=1}^n \prod_{s=1}^t \Omega(x_s + 1) \epsilon_{s+1}$, and the dynamic programming algorithm is a forward-backward algorithm using the following recursive formulae:

$$\epsilon_{t+1} = \beta \sum_{i=1}^n (1 + \epsilon_{t+1,i})$$

Algorithm 1 Greedy Boosting for CRF

```

input:
for  $t = 1$  to  $T$  do
  for  $i = 1$  to  $n$  do
    calculate  $\epsilon_{t,i}$  using dynamic programming
  end for
  for  $i = 1$  to  $n$  do
    calculate  $\epsilon_{t,i}$  using dynamic programming
  end for
  for  $i = 1$  to  $n$  do
    calculate  $\epsilon_{t,i}$  using dynamic programming
  end for
end for

```

Corollary 4.4. When ϵ is the index set of weak predictors, ϵ is the index set of weak predictors in the CRF.

Based on Theorem 4.1 and 4.2, we can get an efficient gradient boosting algorithm for CRF (GB-CRF), which is presented in Algorithm 1. This is a strong result, since we can avoid computing the gradient at each iteration. At the beginning, when each variable is nearly independent from each other, we will have ϵ_i that is close to 0 (and the gradient are approximately 0 because of the regularizer being independent on each other (resulting in zero-derivative updates)).

Relative to LightGBM: Our algorithm can be viewed as a generalization of split-tree classification using LightGBM (Liu et al., 2016). When $\epsilon = 0$ in Eq. (5), our model degenerates to LightGBM. When the variables are not independent, the interaction of ϵ in Eq. 4 and Algorithm 1 naturally captures the interaction. When the variables are not independent, our model outperforms the independent model in the MIMIC data using rate to guide the boosting algorithm in each iteration.

Chen, Singh, Taskar, Guestrin

Lemma 3.1.

$$2p_t \sum_x \|P(y_i, \mathbf{x}, y_i = k) - P(y_i, \mathbf{x})\|_{TV}$$

$$= 2p_t [d(t, t, k) + \sum_{s \neq t} d(s, t, k)]$$

$$\leq 2p_t [d(t, t, k) + \sum_{s \neq t} d(t, t, k) \prod_{(a,s) \in Q(s,t)} \alpha_{k,a}]$$

$$= 2p_t (1 - p_t) [1 + \sum_{s \neq t} \prod_{(a,s) \in Q(s,t)} \alpha_{k,a}]$$

Here the inequality is given by Corollary 3.1 ($d(s, t, k) \leq d(t, t, k) \prod_{(a,s) \in Q(s,t)} \alpha_{k,a}$), and the last equality is given by Lemma 3.3 ($d(t, t, k) = 1 - p_t$). Recall that $H_{k,t} = p_t(1 - p_t)$, we have proved Theorem 4.1. \square

The calculation of γ can be performed using dynamic programming. To explain the algorithm clearly, let us define an auxiliary message variable

$$\beta_{s \rightarrow t} \triangleq \alpha_{k,s} \sum_{h \in V \setminus \{s,t\}} \prod_{(a,h) \in Q(h,s)} (\alpha_{k,a} + 1) \quad (16)$$

We can rearrange $\gamma_i^{(n)}$ in Theorem 4.1 in terms of β , where the index i satisfies $\mu_i = \mathbf{1}(y_i = k)$, as

$$\gamma_i^{(n)}(y, \mathbf{x}) = 2 \left(1 + \sum_{s:(s,i) \in E} \beta_{s \rightarrow i} \right).$$

Similarly for $\gamma_i^{(n)}$ in Theorem 4.2, where the index i satisfies $\mu_i = \mathbf{1}(y_i = k_1, y_i = k_2)$, we have

$$\gamma_i^{(n)}(y, \mathbf{x}) = 2 \left(3 + \sum_{s:(s,i) \in E, s \neq t'} \beta_{s \rightarrow i} + \sum_{s:(s,i) \in E, s \neq t'} \beta_{s \rightarrow t'} \right).$$

The calculation of β can be done efficiently using a message passing algorithm with the following update.

$$\beta_{s \rightarrow t} \leftarrow \alpha_{k,s} \left(1 + \sum_{h:(h,s) \in E, h \neq t} \beta_{h \rightarrow s} \right) \quad (17)$$

In the case of linear chain CRF, our problem is reduced to the calculation of $\beta_{s+1 \rightarrow t} \triangleq \sum_{s=t}^n \prod_{i=s+1}^{t-1} \alpha_{k,i+1}$ and $\beta_{t-1 \rightarrow t} \triangleq \sum_{s=1}^{t-1} \prod_{i=s+1}^{t-1} \alpha_{k,i-1}$, and the message updates in Eq. 17 correspond to a forward-backward algorithm using the following recursion formula:

$$\beta_{t+1 \rightarrow t} = \alpha_{k,t+1} (1 + \beta_{t+2 \rightarrow t+1})$$

Algorithm 1 Gradient Boosting for CRF

```

repeat
  for  $U \in \{N, \mathcal{E}\}$  do
    for  $y, \mathbf{x} \in \mathcal{D}$  in parallel do
      {inference of  $p_i, \gamma_i$  are done using dynamic programming}
      Infer  $G_i(y, \mathbf{x}) \leftarrow \mu_i(y) - p_i$ 
      Infer  $H_{ii}(y, \mathbf{x}) \leftarrow p_i(1 - p_i)$  for each  $i \in U$ 
      Infer  $\gamma_i(y, \mathbf{x})$  using dynamic programming for each  $i \in U$ 
    end for
  end for
  for  $[c] \subset U$  in parallel do
    {We use  $[c]$  to enumerate over set of equivalent index defined by  $C$  in  $\mathcal{U}$ }
     $\delta_c \leftarrow \text{argmin}_{\phi_c \in \mathcal{C}} \sum_{y, \mathbf{x} \in \mathcal{D}} [G_c(y, \mathbf{x}) \delta(y, \mathbf{x}) + \sum_{i \in [c]} \sum_{y, \mathbf{x} \in \mathcal{D}} [G_i(y, \mathbf{x}) \delta(y, \mathbf{x}) + \gamma_i(y, \mathbf{x}) H_{ii}(y, \mathbf{x}) \delta^2(y, \mathbf{x})]]$ 
     $\phi_c \leftarrow \phi_c + c \delta_c$ 
  end for
until convergence
    
```

Corollary 4.1. When U is the index set of node potentials, $\gamma_i = 2n$ satisfies Eq. (6), where n is the number of nodes in the CRF.

Based on Theorem 4.1 and 4.2, we can get an efficient gradient boosting algorithm for CRF (GBCRF), which is presented in Algorithm 1. Here ϵ is a shrinkage term used to avoid overfitting. Our algorithm adaptively estimates γ via the mixing rate calculation at each iteration. At the beginning, when each variable is nearly independent from each other, we will have a γ that is close to 2 (and thus the updates are aggressive). γ increases as the variables become dependent on each other (resulting in more conservative updates).

Relation to LogitBoost: Our algorithm can be viewed as a generalization of multi-class classification using LogitBoost [Friedman et al., 1998]. When $\mathcal{E} = \emptyset$ in Eq. (2), our model degenerates to the LogitBoost model. In this case, the variables in each position are independent, the estimation of γ is 2, and Algorithm 1 is exactly equivalent to LogitBoost. When the variables are dependent on each other, which is common in structured prediction, our model estimates the dependency level via the Markov Chain mixing rate to guide the boosting objective in each iteration.

Call to action

Take the unicorn by the horn

Call to action (from my CAS presentation in 2014)

Who	Takeaways
Casualty Actuarial Society (CAS)	Make data science skills a priority
Actuarial Students	Learn Data Science Skill
Managing Actuaries	Learn enough data science to manage actuarial data scientists Encourage actuarial students to learn and apply data science

Strategic Investment in Actuarial Data Scientist

CAS EXPANDS INTO SPECIALTY CREDENTIALS: NEW CAS INSTITUTE TO LAUNCH CREDENTIAL IN PREDICTIVE ANALYTICS AND DATA SCIENCE

1/16/2015

Analysis: The Institute for Data Science
 The Institute for Data Science (IDSS) is a new specialty credential from the Casualty Actuarial Society (CAS) that will be an important offering for actuaries. IDSS will be the first specialty credential in the actuarial field to focus on predictive analytics and data science. The CAS Institute will develop and deliver the credential in predictive analytics and data science. The CAS Institute will be the first specialty credential in the actuarial field to focus on predictive analytics and data science. The CAS Institute will be the first specialty credential in the actuarial field to focus on predictive analytics and data science.

The CAS Institute is a new entity of the CAS and will be the first specialty credential in the actuarial field to focus on predictive analytics and data science. The CAS Institute will be the first specialty credential in the actuarial field to focus on predictive analytics and data science. The CAS Institute will be the first specialty credential in the actuarial field to focus on predictive analytics and data science.

Call to action - 2015 revised Take the unicorn by the horn

Who	Takeaways
Casualty Actuarial Society (CAS)	Strategic Investment on Data Science for Practitioners Encourage hands-on, pragmatic learning in ICAB curriculum
Actuarial Students	Learn by doing and become part of Data Science communities Focus on pragmatic learning and real world experience
Managing Actuaries	Learn enough data science to manage actuarial data scientists Encourage actuarial students to learn and apply data science

CAS EXPANDS INTO SPECIALTY CREDENTIALS; NEW CAS INSTITUTE TO LAUNCH CREDENTIAL IN PREDICTIVE ANALYTICS AND DATA SCIENCE

11/16/2015 —

Arlington, VA, November 16, 2015 – The Casualty Actuarial Society (CAS) announces the creation of The CAS Institute, an organization offering new credentials and specialized professional education for quantitative professionals looking to remain current in their field. The CAS Institute will develop a curriculum for each of its offered specialty areas, initially covering advanced topics such as predictive analytics and data science. CAS President Bob Miccolis, FCAS, formally introduced The CAS Institute today during the CAS Annual Meeting in Philadelphia.

The CAS Institute is a subsidiary of the CAS and brings the rigorous CAS educational standards to a wider community of quantitative specialists seeking to earn specialized, in-demand credentials and quality professional education to address talent demands, both today and in the future. The CAS will continue to offer actuarial credentials, while The CAS Institute will offer specialty credentials.

CAS EXPANDS INTO SPECIALTY CREDENTIALS: NEW CAS INSTITUTE TO LAUNCH CREDENTIAL IN PREDICTIVE ANALYTICS AND DATA SCIENCE

11/16/2014

Analysis: CAS, November 16, 2014 — The Casualty Actuarial Society (CAS) announced the creation of the CAS Institute, an organization offering new specialty credentials in predictive analytics and data science to help actuaries better serve their clients. The CAS Institute will develop and administer each of the three new credentials, which represent an initial step in CAS's expansion into predictive analytics and data science. CAS President Lee Moore, CAS Institute President Thomas H. Hays and CAS Institute Vice President Michael J. Parnell are shown.

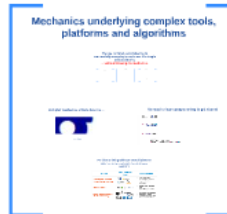

The CAS Institute is a subsidiary of the CAS and will be operated as a separate division of the CAS. The CAS Institute will be a public company, and its shares will be traded on the New York Stock Exchange. The CAS Institute will be a subsidiary of the CAS and will be operated as a separate division of the CAS. What actuaries **DON'T** need to know

**Mechanics underlying complex tools,
platforms and algorithms**

This slide features a diagram of a neural network with multiple layers of nodes. The nodes are represented by small circles, and they are connected by lines representing weights. The diagram is presented in a clean, technical style with a white background and blue accents.

A pragmatic approach for practitioners
Learning Data Science with **automated platform**
and with **business outcome** in focus

This slide contains two bar charts side-by-side. The left chart has a blue bar and a red line, while the right chart has a green bar and a blue line. Both charts show data points over time or across categories, with axes labeled in a small font.

Once you are familiar with real world
experience & practical knowledge—
**Take advantage of free educational
resources** out there

This slide displays logos for three educational platforms: Coursera (orange square), edX (green square), and FutureLearn (yellow square). Each logo is accompanied by its name and a brief description of the platform's offerings.

Call to action
Take the unicorn by the horn

This slide features a logo of a unicorn, which is a mythical creature with the head and front legs of a horse and the tail and hind legs of a bull. The unicorn is depicted in a stylized, blue and white color scheme.
