

**Intermediate Reserving
Boot Camp**

Casualty Loss Reserve Seminar
Anaheim, California
September 6th, 2018

Welcome

- **Introductions**
 - Instructors
 - Karin Rhoads
 - Brian Clancy
 - Scott Lamb
 - Andrew Somers

Agenda

- **Session 1**
 - Reserving Level-Set
 - Chain Ladder and Mix Changes
 - Tails
- **Session 2**
 - Recap
 - Berquist-Sherman Adjustments
 - Cape Cod

Agenda

Session 2

BERQUIST-SHERMAN

Change In Operations

- Change in Case Reserve Adequacy
- Change in Coverages or Policy Terms
- Shifting legal climate or change in laws
- Change in territory, class or size of risks

Strategies for Addressing Change

- **Data Selection and Rearrangement**
 - Case Reserve Adequacy
 - Paid Losses instead of Incurred
 - Coverage Changes
 - Policy Year instead of Accident Year
 - Law Changes
 - Report Year instead of Accident Year
 - Change in Underlying Mix
 - Divide data into smaller, more homogenous groups

Strategies for Addressing Change

- **Quantitative Adjustments to the Data**
 - Change in Case Reserve Adequacy
 - Adjust the case outstanding triangle to account for the change
 - Change in Claim Payments/Closure Rates
 - Adjust the paid loss triangle
- B-S method makes these adjustments to the data before applying traditional development methods

CAPE COD

Review of Bornhuetter-Ferguson

- Splits Ultimate Losses into two components
 - Actual Reported
 - Expected Unreported
- Assumption:
 - Unreported Losses will emerge in accordance with Expected Losses

Review of Bornhuetter-Ferguson

- Expected Loss Ratio
 - Used to estimate Expected Losses
 - Predetermined
 - May be judgmental
- Less susceptible to distortion from random early fluctuations in loss experience than Chain-Ladder

Cape Cod is similar

- Similar concept to Bornhuetter-Ferguson
- Cape Cod splits Ultimate Losses into two components
 - Actual Reported
 - Expected Unreported
 - Same splits as B-F

Difference from B-F

- The difference is in the derivation of the Expected Loss Ratio
 - Based on Reported Losses
 - Not usually judgmental
- Introduces “Used Up” concept to better match earned premiums to reported losses

Derivation of Expected Loss Ratio

- “Used Up” Premium
 - Portion of the premium that corresponds to losses reported through the valuation date
 - Inverse of Cumulative Development Factor is % of Ultimate Reported
 - This % is applied to Earned Premium
 - Denominator in Cape Cod ELR

Ultimate Reported Example

- % of Ultimate Expected Reported = $1 \div \text{Cumulative Incurred LDF}$

AY Age	Cumulative Incurred Development Factors	Percent of Ultimate Expected	
		Reported	Unreported
48	1.000	100.0%	0.0%
36	2.000	50.0%	50.0%
24	3.000	33.3%	66.7%
12	4.000	25.0%	75.0%

Development of Expected Loss Ratio

(000's)

Projection of Ultimate Loss

(000's)

Accident Year	Earned Premium	Expected Loss Ratio	Expected Ultimate Losses	LDF to Ultimate	% Ult Unreported	Expected Unreported Losses	Reported Incurred Loss	Projected Ultimate Loss
2011	830,775	24.4%	202,359	1.112	10.1%	20,381	252,914	273,295
2012	800,295	24.4%	194,934	1.153	13.3%	25,867	206,907	232,774
2013	904,278	24.4%	220,262	1.162	13.9%	30,708	214,785	245,493
2014	1,031,438	24.4%	251,236	1.213	17.6%	44,116	197,022	241,139
2015	1,209,428	24.4%	294,590	1.309	23.6%	69,540	185,290	254,830
2016	1,367,756	24.4%	333,155	1.611	37.9%	126,355	155,964	282,319
2017	1,569,261	24.4%	382,237	2.833	64.7%	247,314	101,608	348,922
Total	7,713,232		1,878,772			564,282	1,314,490	1,878,772

Cape Cod Uses

- Prior selection of ELR not available
 - Reinsurance
- Changing Claim Emergence
 - More responsive than B-F

Cape Cod Uses

- Trended On-level Expected Loss Ratio
 - Adjusts for changing rate/cost environments
 - Applicable to pricing studies
 - Useful in reserving also
 - After selecting ELR, have to back out trends and on-level adjustments to determine individual year ultimate losses

When doesn't Cape Cod work?

- Sparse experience
 - Need enough data to develop the ELR
- Volatile lines
 - Overly influence the ELR
- Widely Variable or Uncertain LDF's
 - Affects the calculation of Used Up Premium
- Changing Reserve Adequacy or Product Mix

Conclusions

- In the first session
 - Workers Compensation basics
 - Change in mix in the data
 - Tail Factors
- In this session
 - Handling Change in case reserve adequacy using Berquist Sherman
 - Using Cape Cod method

Questions and Discussion
