

Solving the Puzzle: Reconciliation of Exposure and Experience Rating

**John Buchanan
CARE Seminar – INTMD2
Philadelphia, PA
June 6, 2011**

CARE 2011 – Solving the Puzzle

PLATINUM
UNDERWRITERS REINSURANCE, INC.

Antitrust Notice

- The Casualty Actuarial Society is committed to adhering strictly to the letter and spirit of the antitrust laws. Seminars conducted under the auspices of the CAS are designed solely to provide a forum for the expression of various points of view on topics described in the programs or agendas for such meetings.
- Under no circumstances shall CAS seminars be used as a means for competing companies or firms to reach any understanding – expressed or implied – that restricts competition or in any way impairs the ability of members to exercise independent business judgment regarding matters affecting competition.
- It is the responsibility of all seminar participants to be aware of antitrust regulations, to prevent any written or verbal discussions that appear to violate these laws, and to adhere in every respect to the CAS antitrust compliance policy.

**INTMD-2:
Solving the Puzzle:
Reconciliation of Exposure and Experience Rating**

A simple yet powerful method will be presented that takes the approach that each account is a puzzle to be solved. A reconciliation of the prior sessions results will be given, along with additional credibility considerations between the methods. This session is a continuation of the "Introduction to Exposure and Experience Rating" Case Study that introduces the rating methods.

Moderator/Panelist:

John Buchanan, Senior Vice President, Platinum Underwriters Reinsurance Inc.

Panelists:

Michael E. Angelina, Chief Actuary and Chief Risk Officer, Endurance Specialty Holdings, Ltd.

Stephen Philbrick, Vice President, Swiss Reinsurance America Corporation

3

Agenda

- Introduction to Hybrid Method (20 mins – John)
- Credibility Issues (20 mins – Steve)
- Reconciliation of the Results (20 mins – Mike)
- Questions
- Appendix

4

Solving the Puzzle

- Traditional Methods Recap
- Hybrid Method: Experience / Exposure
 - Reserving analogy
 - Fundamental assumptions
 - Basic steps
 - Case study challenges
 - Changing policy limits
 - Clash contracts

Appendix

- Other considerations in attempting to solve the puzzle
- Underwriting cycle: soft market experience model bias

5

Traditional Methods Recap

Experience

- Relevant parameter defaults/overrides for:
 - LDFs (excess layers)
 - Trends (severity, frequency, exposure)
 - Rate changes
 - LOB/Hazard Grp indicators
- Adjust for historical changes in:
 - Policy limits
 - Exposure differences
 - Careful “as-if”

Exposure

- Relevant parameters defaults/overrides for:
 - ILFs (or ELFs, PropSOLD)
 - Direct loss ratios (on-level)
 - ALAE loads
 - Policy profile (LOB, HzdGrp)
 - Limit/subLOB allocations
- Adjust for expected changes in:
 - Rating year policy limits
 - Rating year exposures expected to be written

6

Hybrid Pricing Method Reserving Analogy

7

Fundamental Assumptions of the Hybrid Method

- In **theory**, with perfect modeling and sufficient data the results under the Experience and Exposure methods will be identical. (*never attainable*)
- In **practice**,
 - if the model and parameter selections for both Experience and Exposure methods are proper and relevant,
 - then the results from these methods will be similar,
 - except for credibility and random variations.
- Lower layer experience helps predict higher less credible layers.
- Frequency is a more stable indicator than total burn estimates.

8

Basic Steps of The Hybrid Method

1. Estimate Experience burns & counts
2. Estimate Exposure burns & counts
3. Calculate Experience/Exposure frequency ratio by attachment point
4. Review Hybrid frequency ratio patterns
 - Adjust experience or exposure models if needed and re-estimate burns
5. Similarly review excess severities and/or excess burns
6. Combine Hybrid frequency/severity results
7. Determine overall weight to give Hybrid

9

Step 1d-Recap: Estimation of Experience Burns, Counts and Implied Severities

Experience - Traditional Burning Cost Method						
Layer (Limit xs Retention)	Indicated Experience Burn (%)	Ultimate Loss (USD)	Excess Claim Counts	Implied Severity		
50,000 xs 200,000	1.19%	1,322,008	27.05	48,874		
100,000 xs 250,000	1.52%	1,691,358	24.54	68,919		
150,000 xs 350,000	0.89%	984,586	12.05	81,695		
500,000 xs 500,000	0.41%	456,121	2.69	169,751		
250,000 xs 750,000	0.09%	95,024	0.54	176,822		
1,000,000 xs 1,000,000	0.03%	30,874	0.36	86,177		

To be compared to exposure counts

10

Step 2: Estimation of Exposure Burns Bifurcated Between Counts and Severities

Layer	Exposure Method			
	Indicated Exposure Burn (%)	Ultimate Loss (USD)	Benchmark Excess Claim Counts	Benchmark Severity
50,000 xs 200,000	1.51%	1,671,633	38.05	43,937
100,000 xs 250,000	1.92%	2,134,498	29.80	71,616
150,000 xs 350,000	1.33%	1,481,529	15.34	96,588
500,000 xs 500,000	1.54%	1,709,680	6.00	285,088
250,000 xs 750,000	0.27%	296,553	1.90	156,416
1,000,000 xs 1,000,000	0.27%	304,773	0.77	398,338

*12.05 exper / 15.34 expos
= 78.6%*

11

Step 3/4- Review Hybrid Frequency Ratios

Layer	Exposure Method			Hybrid Method	
	Indicated Exposure Burn (%)	Benchmark Excess Claim Counts	Indicated Exper/Expos Freq Ratio	Selected Exper/Expos Freq Ratio	Selected Excess Claim Counts
50,000 xs 200,000	1.51%	38.05	71.1%	80.0%	30.44
100,000 xs 250,000	1.92%	29.80	82.3%	80.0%	23.84
150,000 xs 350,000	1.33%	15.34	78.6%	80.0%	12.27
500,000 xs 500,000	1.54%	6.00	44.8%	80.0%	4.80
250,000 xs 750,000	0.27%	1.90	28.3%	80.0%	1.52
1,000,000 xs 1,000,000	0.27%	0.77	46.8%	80.0%	0.61
Total	1.81%		75.1%	80.0%	

Important Selection

6.00 expos x 80.0%

12

Step 4a: Review Exper/Expos Frequencies Attachment Point Pattern: 200k...1mm

Att Pt.	# of Claims Expected in Rating Year			Exper/ Expos Ratio
	Exposure	Exper-TBC	Hybrid	
200,000	38.0	27.0	30.4	71.1%
250,000	29.8	24.5	23.8	82.3%
350,000	15.3	12.1	12.3	78.6%
500,000	6.0	2.7	4.8	44.8%
750,000	1.9	0.5	1.5	28.3%
1,000,000	0.8	0.4	0.6	46.8%

13

Step 4b: Inspect Experience/Exposure Ratios by Attachment Point

Ideal Situation

- No noticeable slope to ratio of Experience/Exposure
- Random fluctuation around mean

14

Step 4c: Pressure Indicators - Inspect Burn ratios by Year

Upward slope pressure indicators:

- Not enough trend
- Too much LDF
- Too much later year rate change
- Too much earlier year rate change
- ...

Downward slope pressure indicators:

- Too much trend
- Not enough LDF
- Not enough later year rate change
- Not enough earlier year rate change
- ...

15

Steps 1-7: Bringing it All Together

A. Experience Method - Traditional Burning Cost (USD) Step 1								C. Experience / Exposure Indicated and Selected Ratios Step 3 Step 5					
Subject Premium: 111,000,000								Step 4					
1	2	3	5	7	8			10	11	12	13	14	15
Experience Method - TBC								Hybrid Method					
Layer (Limit xs Retention)		Indicated Experience Burn (%)	Ultimate Loss (USD)	Excess Claim Counts	Implied Severity			Indicated Exper/Expos Freq Ratio	Selected Exper/Expos Freq Ratio	Base Layer Weights	Dev/Trended # of Claims	Actual # of Claims	Weight to Experience Severity
			[5xSP1]		[67]			[A7/B7]		[V 13]			
1	50,000	xs 200,000	1.19%	1,322,008	27.05	48,874	71.1%	80.0%	39.9%	189.4	178	100.0%	
2	100,000	xs 250,000	1.52%	1,691,358	24.54	68,919	82.3%	80.0%	36.5%	173.4	129	100.0%	
3	150,000	xs 350,000	0.89%	984,586	12.05	81,695	78.6%	80.0%	18.1%	85.8	54	85.0%	
4	500,000	xs 500,000	0.41%	456,121	2.69	169,751	44.8%	80.0%	4.5%	21.3	11	22.5%	
5	250,000	xs 750,000	0.09%	95,024	0.54	176,822	23.3%	80.0%	0.6%	3.1	2	5.0%	
6	1,000,000	xs 1,000,000	0.03%	30,874	0.36	86,177	46.8%	80.0%	0.4%	2.1	0	2.5%	
Total			0.44%	486,996	2.69	181,241	75.1%	80.0%	49.9%	475.0	374		

B. Exposure Method (USD) Step 2								D. Hybrid Method (USD) Step 6			
Subject Premium: 111,000,000								Step 7			
1	2	3	5	7	8			10	11	12	13
Exposure Method								Hybrid Method			
Layer (Limit xs Retention)		Indicated Exposure Burn (%)	Indicated Ultimate Loss (USD)	Benchmark Excess Claim Counts	Benchmark Severity			Selected Excess Claim Counts	Selected Severity (Wtd)	Selected Hybrid Burn (%)	Selected Ultimate Loss
			[5xSP1]		[67]			[B7xC11]	[V A8,B8,C15]	[13xSP1]	[10x1]
1	50,000	xs 200,000	1.51%	1,671,633	38.05	43,937	30.44	48,874	1.34%	1,487,569	
2	100,000	xs 250,000	1.92%	2,134,498	29.80	71,616	23.84	68,919	1.48%	1,643,296	
3	150,000	xs 350,000	1.33%	1,481,529	15.34	96,588	12.27	84,218	0.93%	1,033,439	
4	500,000	xs 500,000	1.54%	1,709,680	6.00	285,088	4.80	259,137	1.12%	1,243,242	
5	250,000	xs 750,000	0.27%	296,553	1.90	156,416	1.52	157,436	0.22%	238,790	
6	1,000,000	xs 1,000,000	0.27%	304,773	0.77	398,338	0.61	390,534	0.22%	239,042	
Total			1.81%	2,014,454	6.00	335,909			1.34%	1,482,284	

16

Case Study Challenge (Changing Policy Limits - Example #2)

- In this case study, there is an inconsistent relationship as move up the attachment points
- While the low layer Experience is about half of Exposure, the upper layers are about equal to Exposure
- Need more investigation to reconcile and help solve the puzzle

17

Adjusting Experience for historically higher policy limits

Hybrid Analysis - Example #2 (before investigation)							
1	2	3	4	5	6	7	8
	Layer (Limit xs Retention)		Experience Excess Claim Counts	Exposure Excess Claim Counts	Indicated Exper/Expos Freq Ratio	Indicated Exper/Expos Burn Ratio	Devt & Trended # of Claims
1	125,000	xs 75,000	10.2	23.5	43.4%	43.4%	54.8
2	100,000	xs 100,000	9.6	20.9	45.8%	47.3%	51.3
3	350,000	xs 150,000	6.2	5.6	110.1%	86.3%	32.9
4	300,000	xs 200,000	5.6	4.1	135.5%	96.1%	28.4
Total / Average					72.9%	61.9%	

Hybrid Summary - Example #2 (after investigation)							
1	2	3	4	5	6	7	8
	Layer (Limit xs Retention)		Experience Excess Claim Counts	Exposure Excess Claim Counts	Indicated Exper/Expos Freq Ratio	Indicated Exper/Expos Burn Ratio	Devt & Trended # of Claims
1	125,000	xs 75,000	10.2	23.5	43.4%	43.4%	54.8
2	100,000	xs 100,000	9.1	20.9	43.5%	44.9%	51.3
3	350,000	xs 150,000	3.7	5.6	66.1%	56.1%	32.9
4	300,000	xs 200,000	2.2	4.1	54.2%	38.4%	28.4
Total / Average					49.7%	45.5%	
Selected Hybrid frequency ratio					50.0%		

- Investigating the analysis more deeply, we noticed that the historical policy limits are significantly higher than the projected policy limits. The "after investigation" analysis incorporates an adjustment to our experience analysis to reflect lower rating year limits.

18

Case Study Challenge Adjusting Exposure for clash potential

Hybrid Analysis - Example #3 (before investigation)									
1	2	3	4		5		6	7	8
Layer (Limit xs Retention)			Experience Excess Claim Counts	Exposure Excess Claim Counts	Experience Method - TBC		Indicated Exper/Expos Freq Ratio	Indicated Exper/Expos Burn Ratio	Developed & Trended # of Claims
					[4/5]				
1	1,000,000	xs	1,000,000	16.0	23.5	67.9%	77.9%	106.7	
2	1,000,000	xs	2,000,000	7.5	8.8	84.5%	85.6%	48.1	
3	1,500,000	xs	3,500,000	3.4	4.5	76.3%	91.7%	22.3	
4	2,500,000	xs	5,000,000	2.1	3.0	71.9%	73.9%	14.7	
5	2,500,000	xs	7,500,000	1.06	1.32	81.0%	74.8%	8.5	
6	10,000,000	xs	10,000,000	0.64	0.48	134.0%	212.9%	4.4	
7	15,000,000	xs	20,000,000	0.43	0.11	386.4%	372.7%	2.5	
8	25,000,000	xs	35,000,000	0.00	0.03	0.0%	0.0%	0.0	
Total / Average						78.8%	90.7%		

Hybrid Analysis - Example #3 (after investigation)									
1	2	3	4		5		6	7	8
Layer (Limit xs Retention)			Experience Excess Claim Counts	Exposure Excess Claim Counts	Experience Method - TBC		Indicated Exper/Expos Freq Ratio	Indicated Exper/Expos Burn Ratio	Developed & Trended # of Claims
					[4/5]				
1	1,000,000	xs	1,000,000	16.0	22.2	71.9%	81.7%	106.7	
2	1,000,000	xs	2,000,000	7.5	8.8	85.1%	86.2%	48.1	
3	1,500,000	xs	3,500,000	3.4	4.5	75.4%	90.4%	22.3	
4	2,500,000	xs	5,000,000	2.1	3.0	70.6%	71.2%	14.7	
5	2,500,000	xs	7,500,000	1.06	1.47	72.4%	66.8%	8.5	
6	10,000,000	xs	10,000,000	0.64	1.07	59.8%	89.5%	4.4	
7	15,000,000	xs	20,000,000	0.43	0.48	88.6%	79.9%	2.5	
8	25,000,000	xs	35,000,000	0.00	0.13	0.0%	0.0%	0.0	
Total / Average						75.2%	82.7%		
Selected Hybrid frequency ratio						85.0%			

Benefits of Hybrid Method

- One of main benefits is questioning Experience and Exposure Selections
 - To the extent credible results don't line up, this provides pressure to the various default parameters
 - For example, there would be downward pressure on default exposure ILF curves or loss ratios if
 - Exposure consistently higher than experience, and
 - Credible experience and experience rating factors
- A well constructed Hybrid method can sometimes be given 100% weight if credible
- Can roll-up Hybrid results across accounts to evaluate pressure on industry defaults

Other Considerations in Attempting to Solve the Puzzle

Appendix

- Credibility
- Rolling-up Accounts and Reconciling to Industry Defaults
- Underwriting Cycle

21

Credibility

•**Experience Rating** = Projection of losses based only on what took place for this specific account

•**Exposure Rating** = *A Priori* estimate of losses based on information other than the specific account's experience in the layer

- Other similar accounts
- "Industry"

22

Credibility

- Separating claim counts is useful for comparing experience and exposure ratings, and also for gauging credibility.
- A good credibility standard is: the number of claims that we would have expected to observe in the historical periods.

$$Z = \frac{n}{n + k}$$

23

Credibility: Other Considerations

- Stability of Experience: How much would experience rate change if we remove the largest claim or add an additional full limit loss?
- Are pricing factors (LDFs, rate changes, etc) from the account or are they default values?
- Do the characteristics of the ceding company match the business in the exposure rating curves?

24

Assessing Credibility of Exposure Method

- Assess confidence due to:
 - Exposure curve selected
 - Exposure profile
 - Source of hazard or sub-line information
 - Prediction of next years primary loss ratio
 - Percentage of non-modeled exposure, clash, etc.
 - Company strategy and ability to realize strategy
- Possibly take questionnaire / scoring approach to mechanize (Patrik/Mashitz)

25

Assessing Credibility of Experience Method

- Assess confidence due to:
 - Overall volume of claims
 - Volume of claims within layer (*lucky or unlucky?*)
 - Stability of year by year Experience results
 - “ layer to layer Hybrid ratios
 - Source of loss development, trend factors, historical rate changes and deviations
 - Changes in historical profile limits affecting claims
 - Appropriateness of any claims or divisions that may have been removed (or “as-if’d”)
 - Including additional large claim(s) if feel account “lucky”
 - Underwriter “as-if” scorecard – soft market
- Experience score compared to exposure score to determine credibility weight

26

Classical Credibility Weighting Techniques

- Select credibility weights using combination of:
 - Formulaic Approach
 - Expected # of Claims / Variability
 - Exposure ROL (or burn on line)
 - Questionnaire Approach
 - Apriori Neutral vs. Experience vs. Exposure
 - Patrik/Mashitz paper
 - Judgment
- Need to check that burn patterns make sense
 - i.e. higher layer ROL < lower ROL
 - similar to Miccolis ILF consistency test
 - plot ROL's to see if pattern makes sense

27

Classical Credibility Weighting

Limit	Retention	Experience	Exposure	Credibility Weight	Selected Burn
50,000	200,000	1.19%	1.50%	100.0%	1.19%
100,000	250,000	1.52%	1.91%	90.0%	1.56%
150,000	350,000	0.89%	1.33%	75.0%	1.00%
500,000	500,000	0.41%	1.53%	50.0%	0.97%
250,000	750,000	0.09%	0.27%	25.0%	0.22%
1,000,000	1,000,000	0.03%	0.27%	10.0%	0.25%

- o Credibility weights can be judgmentally or formula selected*
- o Soft market pressure to give more weight to experience indication when lower (perhaps implicitly by underwriter or management override)*

28

Increase Credibility by Reducing Variability

FIGURE 1

- Above figure from iconic Philbrick CAS paper
- In this case, A represents Experience rating average (with indicated process noise), while B represents Exposure
- Goal will be to bring A and B closer together thereby reducing parameter variance, with any remaining difference being process noise

29

Roll-up Results across Accounts

Test of Default Parameters

- Aggregate across “similar” accounts to evaluate pressure on industry defaults
 - May want to re-rate accounts using e.g. default rate changes, ILFs, premium allocations, LDFs, trends, etc.
- Each individual observation represents a cedant/attachment point exper/expos ratio
- Review dispersion of results and overall trend
 - E.g. if weighted and/or fitted exper/expos ratios are well below 100% (or e.g. 90% if give some underwriter credit) then perhaps default L/Rs overall are too high (or conversely LDFs or trends too light)
 - If trend is up when going from e.g. 100k to 10mm att pt, then perhaps expos curve is predicting well at lower points but is underestimating upper points

30

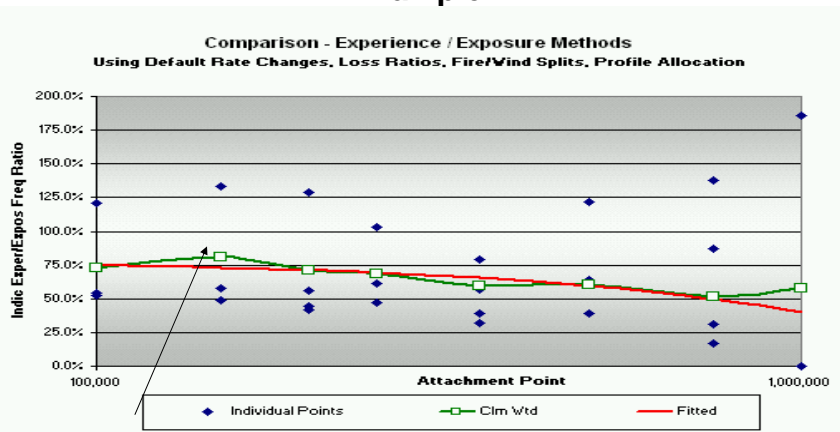

Roll-up Results across Accounts

Test of Default Parameters (cont.)

- Before making overall judgments, must consider
 - UW contract selectivity (contracts seen vs. written),
 - Sample size (# of cedants/years),
 - Impact “as-if” data (either current or historical)
 - Survivor bias
 - Systematic bias in models
 - “Lucky”

31

Hybrid roll-ups: Test of Default Factors Example 1

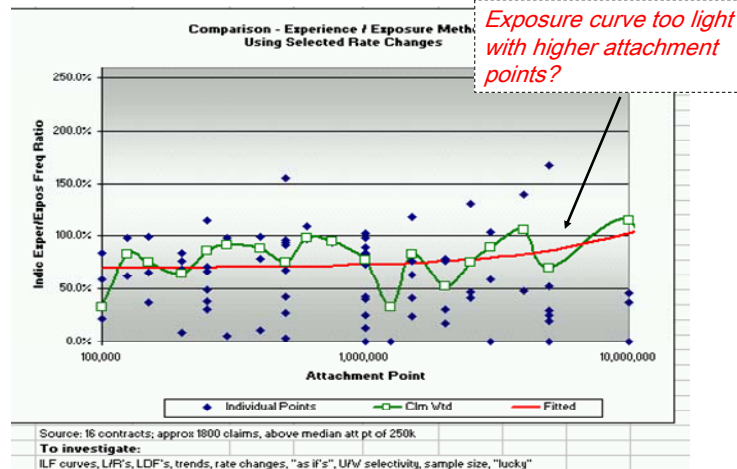

*Well below 100%,
pressure to reduce expos
params or increase exper
params...but credible??*

Average Exper/Expos Freq Ratio		Dispersion Statistics	
Arithmetic Avg=	65.1%	Total # > 90% =	7 25.9%
Sumproduct(olms)	72.5%	Total 0; # < 90% =	20 74.1%
		Total # > 0% =	27 100.0%
		Total # = 0	3
		Total # =	30
		U/w Selectivity =	90.0%

JZ

Test of Default Rating Factors – Example 2

33

Underwriting Cycle

- Hard market vs. Soft market
- Calendar year vs. accident year
 - Difficulty in estimating true results – information lag
 - Sometimes takes years to properly estimate
 - Wrong signal consequences
- Forensic analysis of cycle
 - Numerator impacts (loss trends, new plateaus, shock losses)
 - Denominator impacts (rate changes, terms and conditions)
- Relative magnitude of components
 - Losses
 - Rates
 - Reserve adequacy (no impact if able to review "true" AY results)
 - Which is larger impact, losses or rates? Perhaps vary by line
- Hypothesis
 - Soft market bias towards Experience model results
 - Could be implicit by underwriters or management override

34

Underwriting Cycle - CY vs. AY Operating Ratio

Source: MPL Sch P @ 12/31/2009 by Rich Lino - Oliver Wyman
 AY reported results including IBNR reported as of December 31, 2008 (or 9 years after AY, if earlier)
 AY estimates reflect investment yield of 0.5% above 5-year US Treasury Rate

Underwriting Cycle – CY vs. AY Apparent vs. Actual Market Signals

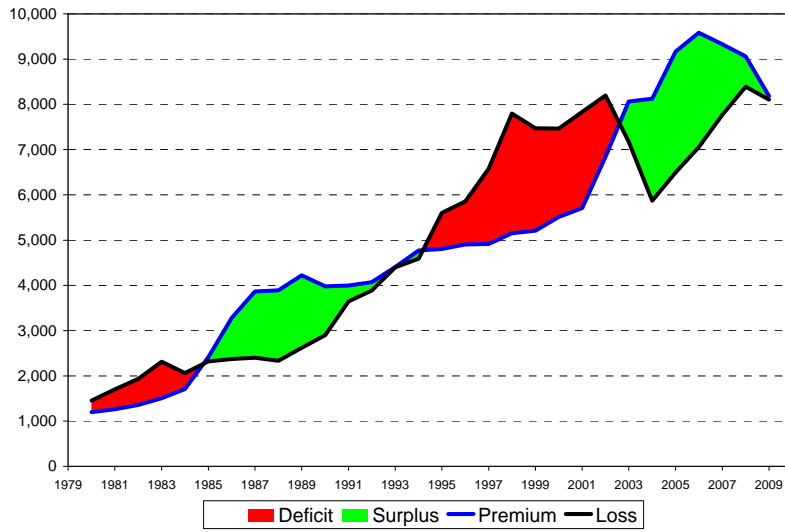

# Years	Actual - AY			
Apparent - CY	Hard	Transitional	Soft	Total
Hard	3	7	3	13
Transitional	5	0	7	12
Soft	0	2	3	5
Total	8	9	13	30

Avg. LR Gap	Actual - AY			
Apparent - CY	Hard	Transitional	Soft	Total
Hard	2.1%	24.5%	48.4%	24.8%
Transitional	-26.0%	0.0%	37.5%	11.1%
Soft	0.0%	-33.1%	-1.9%	-14.4%
Total	-15.5%	11.7%	30.9%	

Red Years = CY indications -> write MORE business, while actual results much WORSE (average=37% worse)
 Blue Years = CY indications -> write LESS business, while actual results much BETTER (average = 28% better)

Source: MPL Sch P @ 12/31/2009 by Rich Lino - Oliver Wyman

Historical Look at MPL Industry UW Performance - AY

Source: Sch P @ 12/31/2009 by Rich Lino - Oliver Wyman
AY reported results including IBNR reported as of December 31, 2008 (or 9 years after AY, if earlier)
AY estimates reflect investment yield of 0.5% above 5-year US Treasury Rate
