1. The Casualty Actuarial Society is committed to adhering strictly to the letter and spirit of the antitrust laws. Seminars conducted under the auspices of the CAS are designed solely to provide a forum for the expression of various points of view on topics described in the programs or agendas for such meetings.
 2. Under no circumstances shall CAS seminars be used as a means for competing companies or firms to reach any understanding – expressed or implied – that restricts competition or in any way impairs the ability of members to exercise independent business judgment regarding matters affecting competition.
 3. It is the responsibility of all seminar participants to be aware of antitrust regulations, to prevent any written or verbal discussions that appear to violate these laws, and to adhere in every respect to the CAS antitrust compliance policy.

PROPERTY AND CASUALTY: SEPARATED AT BIRTH

Munich Reinsurance America, Inc.
Dave Clark

1. Property and Casualty wear different masks
2. How to “correct” the loss ratios by LOB
3. Modelling the correlation in ERM

Property and Casualty lines of business are often sold together and are subject to similar market forces. However, published results do not always show a strong correlation.

- Small commercial insurance is often explicitly “packaged” as BOP or CMP
- Large account businesses purchase separate policies, but often involve the same buyers, sellers and intermediaries.
- For (re)insurers, we often hear “*you need to think about the whole account*”

Property results are subject to the market cycle, but this is masked by catastrophes and other large loss events.

Casualty results are subject to the market cycle, but this is masked by the very slow recognition of ultimate results in the reserving process.

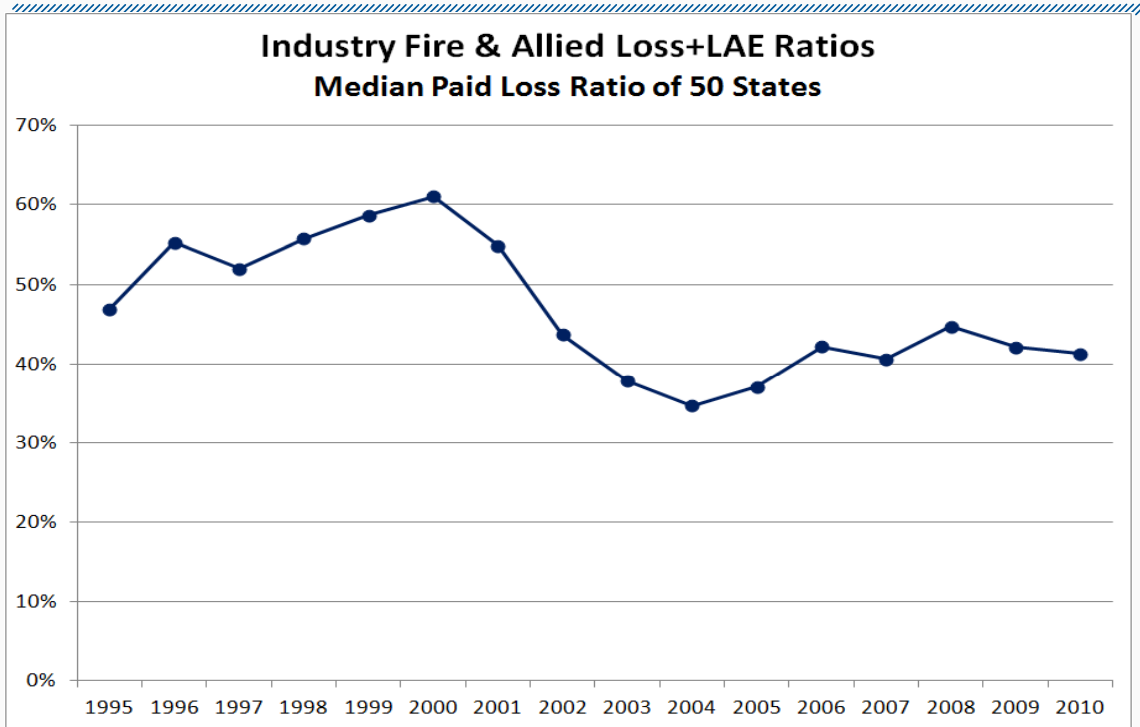

Similar patterns – covered by different masks.

Separated at Birth - Property Loss Ratios including catastrophes

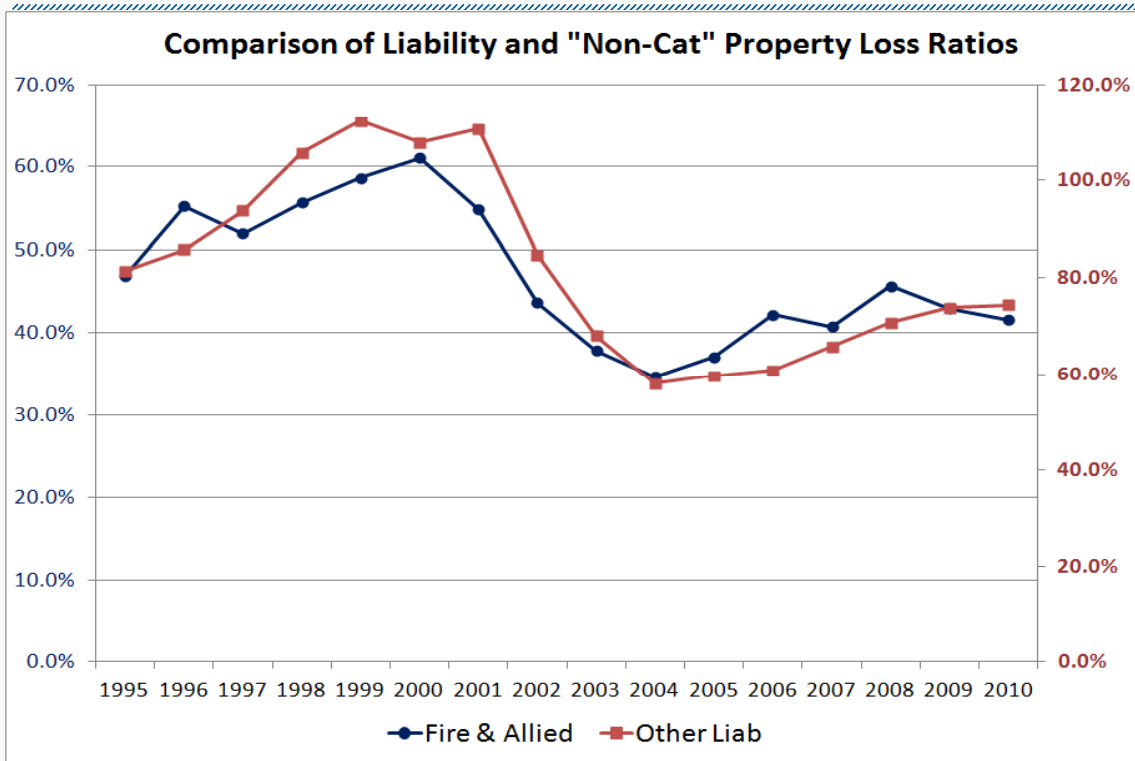

Separated at Birth - Property Loss Ratios excluding catastrophes (via median)

Separated at Birth – Casualty Loss Ratios

9

Separated at Birth

Correlation coefficient for the “true” ultimate loss ratio for Other Liability with the non-catastrophe portion of Fire & Allied is about .926. Other lines of business show similarly strong correlation.

The primary reason for this correlation is the common market cycle affecting all lines of business.

A secondary reason for the correlation may be that economic costs will be co-integrated over the long term.

Separated at Birth - Two Methods for including LOB Correlation in Enterprise Risk Models

Implicit:

- Do not adjust historical results to current level
- Estimate correlations based on historical loss ratios
- Model correlation via copula

Explicit:

- Adjust historical results to current cost and rate level
- Explicitly model market cycle and economic forces
- Apply the market cycle and economic forces as separate level of simulation, applicable to all lines of business
- Scatter Plot of results can be used to show the dependence (copula is output, not input)

13

Dependence of Correlation Coefficient on Volume and Grouping

Suppose we have a company writing twelve identical risks (policies).

And the correlation coefficient between any two risks is .2.

	Risk 1	Risk 2	Risk 3	Risk 4	Risk 5	Risk 6	Risk 7	Risk 8	Risk 9	Risk 10	Risk 11	Risk 12
Risk 1	1	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2
Risk 2	0.2	1	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2
Risk 3	0.2	0.2	1	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2
Risk 4	0.2	0.2	0.2	1	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2
Risk 5	0.2	0.2	0.2	0.2	1	0.2	0.2	0.2	0.2	0.2	0.2	0.2
Risk 6	0.2	0.2	0.2	0.2	0.2	1	0.2	0.2	0.2	0.2	0.2	0.2
Risk 7	0.2	0.2	0.2	0.2	0.2	0.2	1	0.2	0.2	0.2	0.2	0.2
Risk 8	0.2	0.2	0.2	0.2	0.2	0.2	0.2	1	0.2	0.2	0.2	0.2
Risk 9	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	1	0.2	0.2	0.2
Risk 10	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	1	0.2	0.2
Risk 11	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	1	0.2
Risk 12	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	1

14

Dependence of Correlation Coefficient on Volume and Grouping

Next we will group these risks into two business segments.

What is the correlation coefficient between the two segments?

		Business Segment 1						Business Segment 2					
Business Segment 1	1	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2
	0.2	1	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	
	0.2	0.2	1	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	
	0.2	0.2	0.2	1	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	
	0.2	0.2	0.2	0.2	1	0.2	0.2	0.2	0.2	0.2	0.2	0.2	
	0.2	0.2	0.2	0.2	0.2	1	0.2	0.2	0.2	0.2	0.2	0.2	
Business Segment 2	0.2	0.2	0.2	0.2	0.2	0.2	1	0.2	0.2	0.2	0.2	0.2	
	0.2	0.2	0.2	0.2	0.2	0.2	0.2	1	0.2	0.2	0.2	0.2	
	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	1	0.2	0.2	0.2	
	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	1	0.2	0.2	
	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	1	0.2	
	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	1	

Dependence of Correlation Coefficient on Volume and Grouping

The correlation between any two risks (policies) is .2; but the correlation between the two business segments is .6.

		Business Segment 1	Business Segment 2
Business Segment 1	1	0.6	
Business Segment 2	0.6	1	

////////////////////////////////////

In an explicit model of market cycle, rate/price movement is treated as a secondary random variable. This is sometimes described as a “mixing” variable or a “common shock” model.

The form of this secondary variable creates a copula.

X_1 and X_2 are random variables for two lines of business

Y is a random variable for the market cycle (affecting premium)

If X_1, X_2 are lognormal and Y is also lognormal, then

$F(X_1/Y, X_2/Y)$ follows a Gaussian (bivariate normal) copula

If X_1, X_2 are exponential and Y is gamma, then

$F(X_1/Y, X_2/Y)$ follows a Heavy-Right-Tailed (bivariate Pareto) copula

Scatter Plot from Copula: Heavy Right-Tail (HRT)

Scatter Plot from Copula: Scenario Testing

Correlation due to market cycle is not a diversifiable risk.

However, the market cycle is largely an **epistemic** rather than an **aleatoric** (random) risk. That is, the risk is due to the fact that we do not really know what is being charged for the underlying risks.

While this risk cannot be diversified away, it can be mitigated. The mitigation of the risk is done by improving our knowledge of price adequacy via monitors, audits and controls.

THANK YOU VERY MUCH FOR YOUR ATTENTION.
