

# Concurrent Session 2: International Property

**CAS/CARe Seminar, Bermuda, June 6-7, 2013**  
**John Buchanan, ISO – Excess and Reinsurance**

# Antitrust Notice

- The Casualty Actuarial Society is committed to adhering strictly to the letter and spirit of the antitrust laws. Seminars conducted under the auspices of the CAS are designed solely to provide a forum for the expression of various points of view on topics described in the programs or agendas for such meetings.
- Under no circumstances shall CAS seminars be used as a means for competing companies or firms to reach any understanding – expressed or implied – that restricts competition or in any way impairs the ability of members to exercise independent business judgment regarding matters affecting competition.
- It is the responsibility of all seminar participants to be aware of antitrust regulations, to prevent any written or verbal discussions that appear to violate these laws, and to adhere in every respect to the CAS antitrust compliance policy.

# Concurrent Session 2

## International Property

This session will provide a survey of the International Property market and benchmarking methodologies, with an emphasis on Per Risk covers. Similarities and differences between US and various European, Asia-Pacific and other developed and developing country data sources will be discussed. Various curve applications and adjustments for differences such as construction, occupancy, and protection differences (COPE-ARM adjustments) and resulting macro country-wide validations will be explored. This session will include a case study approach to highlighting sensitivities and pitfalls of having incomplete data.

**Moderator / Panelist:**

John Buchanan, Principal, Excess and Reinsurance Division, ISO

**Panelists:**

Dave Sandeman, Director of Operations, Axco Insurance Information Services  
Christie Lee, Vice President, Guy Carpenter

# Agenda – International Property CS2

- **Overview – John 5 mins**
- **Survey of International Property Markets – Dave 20 mins**
  - Comparison of mature, emerging, and nascent markets
  - North America, Europe, BRICS, CIVETS
  - Statistical and non-statistical factors
- **The Challenges of Having Incomplete Data – Christie 20 mins**
  - Asia-Pacific large property policies
  - Engineering exposures
- **International Property Per Risk Benchmarking – John 20 mins**
  - Adjusting US data for use in other countries – the big issues
  - COPE (ARM) adjustments and cross-country validations
  - Tripod: Mixing ground-up loss costs, non-cat and cat results
- **QA 10 mins**

# International Property Per Risk Benchmarking

# Property Per Risk Benchmarking Agenda

- **Need for Benchmarking – The Big Issues**
  - Exception to “Never make analogies to US business”? \*
- **Adjusting US Data for Use in Other Countries**
  - Property Per Risk Example
  - Establish strong US benchmark
  - Explicitly adjust for differences between US and target countries
    - Using COPE (ARM) adjustments
  - Validation to external sources
- **International Data Collection**
  - Global Benchmarking
  - Collecting carrier specific data
- **“Tripod” Approach – Integrating Multiple Applications**
  - Ground-Up Loss Costs
  - Excess Layers for Non-Cat Business
  - Cat modeling

\* Jeffrey Dollinger – *International Reinsurance: The Education of an American Actuary* – CAGNY May 2013

# The Property Per Risk Benchmarking Issues

## A Survey of International Property Size of Loss Curves

- **The Issues:**
  - Plausible curves need to rely on link between losses and their exposed amounts of insurance
  - Establishing connection between US & International experience – large loss occupancy test
- **Lloyd's Scales**
- **Salzman Scales**
- **Ludwig Tables**
- **Various Reinsurer Based Scales**
  - Swiss Re, Munich Re, Skandia
- **MBBEFD Approximations** (*S. Bernegger*)
  - Modeling loss severity with distributions from Physics
- **Extreme Value Theory** (*G. Ramachandran*)
  - Factors affecting Fire Loss – Multiple regression models
- **ISO – PSOLD International**
  - Based on US Proxy Approach, COPE (ARM), with validation
  - Four countries released so far (UK, Germany, France, Australia)
  - Others in process

# The Property Per Risk Benchmarking Issues

## Illustrative comparison of Fire losses between countries

Table 1.1 International fire costs comparisons

| Country       | Direct fire losses (%) <sup>a</sup> | Indirect fire losses (%) <sup>a</sup> | Costs of fire fighting organisations (%) <sup>a</sup> | Costs of fire insurance administration (%) <sup>a</sup> | Costs of fire protection to buildings (%) <sup>a</sup> | Total cost of fire (%) <sup>a</sup> | Fire deaths per 100,000 persons (%) <sup>b</sup> |
|---------------|-------------------------------------|---------------------------------------|---|---|--|-------------------------------------|--|
| Austria       | 0.21 (79–80)                        | 0.029 (79–80)                         | N.A.  | 0.14 (79–80)  | N.A.   | N.A.                                | 0.74   |
| Belgium       | 0.40 (88–89)                        | N.A.                                  | 0.18 (87–89)  | 0.28  | 0.21 (87–88)   | N.A.                                | 1.47   |
| Canada        | 0.24                                | N.A.                                  | 0.16 (85)   | 0.21 (80–81)  | 0.34   | N.A.                                | 1.58   |

# The Property Per Risk Benchmarking Issues

Comparison of Large Fire Losses by Occupancy – US vs. International

International counts used in establishing First Level validation of PSOLD Int'l results

# Basic Steps in Adjusting US Excess Loss Curves for International

- **Step 1: Validate US Curves – Want Strong Proxy Anchor**
  - US Commercial Property market is 1.5 x size of 7 initial target countries combined
  - Evaluate credibility of US original and fitted data – in total and by component
  - Validate using actual vs. expected large losses (from 25mm to 250mm; NFPA 20 years)
- **Step 2: Adjust US Curves to International – COPE (ARM)**
  - Assess differences in Amounts of Insurance, Occupancy, Protection, Construction, etc.
  - Using various industry exposure databases – US vs. International
  - Consolidate individual selections to total COPE adjustments
- **Step 3: Validate Proxy Curves with Industry Data** *(First Level)*
  - Industry large loss information (FPA-UK, other sources)
  - Compare actual vs. expected claim counts at various attachment points
  - Cross country comparisons – counts and occupancy differences
- **Step 4: Further Validate with Participant Data Collection** *(Second Level)*
  - Submissions: individual large claims
  - Aggregated exposure information

Actual claims from National Fire Protection Association largest claims 1991-2010

- trended to 2012, but not developed beyond 1st report; does not include indirect losses such as TE
- does not include potential protection improvement credits (9 of the 13 >=200mm are from 1990s-trended)

Fitted using all rating groups (38) and states combined; adj. for 50% market share (last 20 year 40-60%)

\* Severe Manufacturing/Petroleum & Highly Protected Risks-Heavy (52 CSP Classes; PSOLD RGs-35,38)

# US to International Property Risk Excess Loss Factors COPE Assessment Matrix – Steps

## 1. Start with a list of potential differences between the US and target countries

- Standard in Property Underwriting is COPE – Construction, Occupancy, Protection, and Exposure
- To this list, we add ARM: Amounts of Insurance, Rebuilding costs, Miscellaneous

## 2. Assess whether each item would favorably or unfavorably impact expected loss results compared to the US

- e.g. expected to **reduce (positive)** or **increase (negative)** the excess losses, no impact or unknown

## 3. Attempt to evaluate magnitude of the impact of each item

- Low, Medium, High, or unknown

## 4. Tally the expected cumulative effect of each of the COPE (ARM) items

- Include direction and magnitude of all items
- Could vary for example by groups of occupancies (e.g. Facilities)

## 5. Reconcile total impact assessment to historical excess loss layers vs. US

- Review actual number of large claims to US, using exposure base such as \$B of subject premium
- Review cross country comparisons

## 6. Can do the same for Ground-up Loss Costs as proxy outside the US

# US to International Property Risk Excess Loss Factors

## PSOLD International: COPE Assessment Matrix (for illustration only)

Commercial / Industrial

|                                       | US | Country A | Country B | Country C | Country D | Country E | Country F | Country G |
|---------------------------------------|----|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| Construction                          |    | H         | M         | L         |           | M         | M         | M         |
| Occupancy                             |    | L         | H         |           | M         |           | H         | L         |
| Protection                            |    |           | M         | M         | M         | H         | M         | H         |
| Exposure (e.g. industrial facilities) |    |           | M         | L         | H         |           |           | L         |
| Amount of Insurance                   |    | M         |           |           | M         | L         | H         | M         |
| Replacement Costs                     |    | M         | L         | H         | L         | L         | H         | M         |
| Miscellaneous                         |    |           | M         |           | L         |           | H         |           |
| Total Indicated (before validation)   |    |           | H         |           | M         | L         | L         | H         |

| Impact Key (compared to US) |               |
|-----------------------------|---------------|
| Direction                   | Worse         |
|                             | Better        |
|                             | No difference |
| Magnitude                   | H = High      |
|                             | M = Moderate  |
|                             | L = Low       |

Same procedure can be applied for Ground-up Loss Costs

**Assumptions: All Industry using 4bn GBP; 40% attritional LR; Bldgs plus contents plus Time Element (BI); All perils x minor and major Cat; All industry AOI and Occupancy based on PSOLD US CP distributions; Time element cap of 300% (PSOLD US Default); Overall loss scalar of .8 to reflect COPE analysis vs. US; Differences in COPE uses various sources including AIR's Industry Exposure Database**

**Range varies overall Loss Scalar, Attritional LR, and Time Element cap**

**Actual losses from Axco Insurance Information Services - 2012- trended using 3% per year**

# PSOLD International Cross Country Comparison (Illustrative)

# Case Study – UK, FR Hotels

- **Steps to Price: Case Study**
- **Ground-up Loss Costs**
  - Can use US as proxy to estimate non-US class based loss costs, using similar COPE and LOI scaling procedure used in PSOLD International
  - Can use Portal values and PSOLD International Utilities
- **Excess Pricing**
- **Cat Pricing**

## Illustrative Case Study Large European Hotels

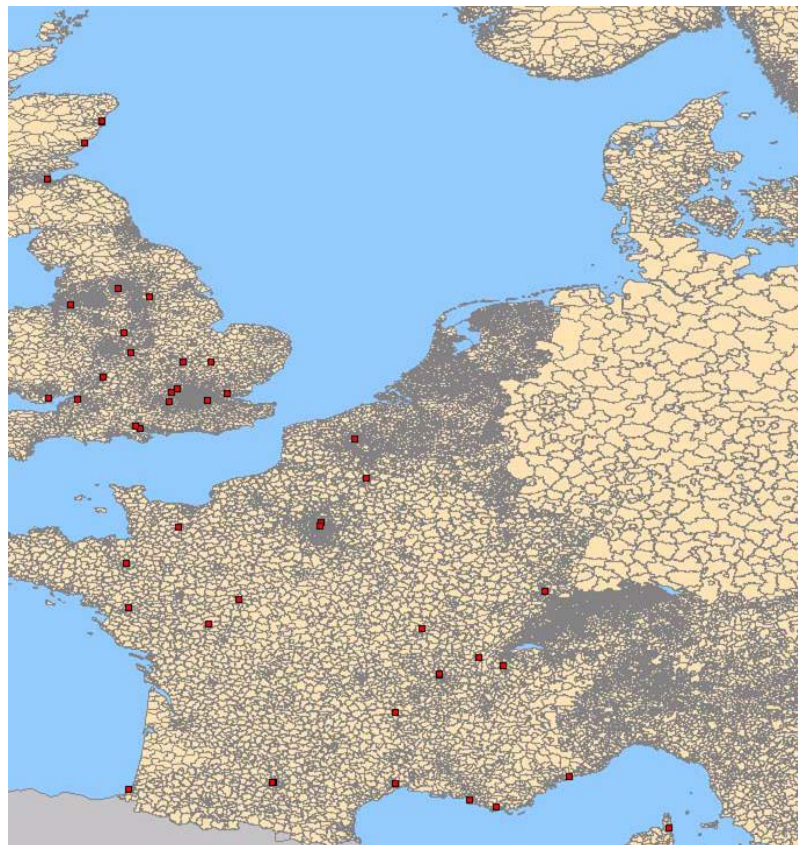

- A hypothetical hotel chain needs insurance on 50 hotels spread over UK and France
- Individual property values range from \$6M to \$120M; aggregate value: \$2.6B
- Coverage: “All Risks of Direct Physical Loss, Damage, or Destruction....”; terrorism exclusion
- Layers starting: \$5M xs \$5M, ..., \$200M xs \$100M
- Sublimit of \$100M for Earthquake peril only

# Illustration of Excess Layering: \$5M excess of \$5M

*What are the expected cat and noncat losses for this layer?*

# Case Study: 50 European Locations

About 90% of GU and 1<sup>st</sup> Layer LC are Noncat in UK and FR

|                       |                     | <b>334,008</b> | <b>24,004</b>          | <b>3,566,510</b> | <b>281,113</b> | <b>3,900,518</b> | <b>305,117</b> |

# Case Study Basic Components

- **US ground-up Loss Costs can be used as proxy for outside the US**
  - Adjust for differences such as construction, occupancy, protection, exposure, amounts of insurance, etc. (COPE-ARM)
- **PSOLD International uses the COPE-ARM procedure to adjust for outside the US**
  - Currently four countries released for Europe (UK, Germany, France, Australia) with others such as Netherlands, Brazil, and Japan being validated
  - Excess layer validations made to large known claims up to 200mm
- **AIR provides catastrophe models covering over 90 countries around the world**
  - Covers perils such as Tropical Cyclones (Hurricanes), Extratropical Storms(Winter Storm), Earthquake, Severe Thunderstorm (Tornado / Hail / Straight-line Wind), Inland Flood, Wildfire, Agriculture, and Terrorism in various countries

## Property Excess Rating: Noncatastrophe Losses First Loss Scale Illustration — \$5M Excess of \$5M

| % of AOI   | % of Loss |
|--|-----------|
| 0.0%   | 0.0%      |
| 10.0%  | 40.0%     |
| 20.0%  | 50.0%     |
|  25.0%  | 60.0%     |
| 30.0%  | 65.0%     |
| 40.0%  | 70.0%     |
|  50.0% | 75.0%     |
| 60.0%  | 80.0%     |
| 70.0%  | 85.0%     |
| 80.0%  | 90.0%     |
| 90.0%  | 96.0%     |
| 100.0%   | 100.0%    |

**AOI = \$20,000,000 (insured value)**

**60% of losses are less than or equal to 25% of AOI. Therefore, 60% of the total ground-up loss costs pays for losses related to the first \$5,000,000 of building value [ $\$5,000,000 = 25\% \times 20,000,000$ ]**

**75% of the ground-up losses pays the losses for the first \$10,000,000 of building value [ $\$10,000,000 = 50\% \times 20,000,000$ ]**

**Therefore, would want to collect 15% (75.0%-60.0%) of the total ground-up expected loss costs for the \$5M excess of \$5M layer**

\* PSOLD has over 1 million individual curves for 60 AOI bands, 38 occupancies, 50 states, 4 sets of perils, etc.

## Step 1: Will Want to Estimate Ground-up Loss Costs Using Proxy Basis

- **ISO's advisory loss costs**
  - Licensed by 1,500 U.S. insurers — 90% of the Commercial Lines market and 45% of Personal Lines market
  - Broad database with credible data at a very detailed level
  - Useful benchmark for underwriting, pricing, and compliance with solvency regulations
- **Can be used to estimate other costs on proxy basis**
  - Ground-up loss costs on class basis in absence of other information
  - Comparison to actual charged or expiring premiums

# Loss Cost Table: Sample (Basic Group 1) UK – Territory B (Use Phoenix, AZ as Proxy)

Basic Group 1 Perils: Fire, lightning, explosion, vandalism, and sprinkler leakage.

## Step 2: Estimate Excess Layer Expected Losses

- **ISO's Property Size of Loss Database (PSOLD)**
  - PSOLD curves based on 20 years of U.S. claims data reported to ISO with loss detail linked to exposure information by amount of insurance, state, occupancy, coverage, peril, etc.
  - Combines very detailed distributions in appropriate mix reflecting location-level ground-up losses
  - Linkage to primary CSP industry and AIR cat model occupancies
- **Macro industry validation for working and high excess layers**
  - Validation to NFPA data on all-industry basis to 200M
- **PSOLD has over 1 million individual curves**
  - 60 AOI bands, 38 occupancies, 50 states, 4 sets of perils, etc.

# Case Study: 50 U.S. Location Results: By Peril

# Appendix

# Benchmarking: Data to Wisdom Conversion

David McCandless // v 0.1 // work in progress  
InformationIsBeautiful.net

# Need for Benchmarking

- Overall effort to convert data into information, knowledge, and wisdom
- Obtain relevant internal and external information to establish companywide benchmarks
  - Information can be used not only for individual account puzzle solving, but also as proxy for entry into new lines of business or territories
  - Actuary, underwriter and management vetting of information annually or as needed – helps establish consistency across units
- After the inevitable loss or series of losses, easier with a benchmarking framework to "fix" the issue that has arisen
- Helps identify areas of potential **"Overconfidence"**
  - The impact due to lack of credibility combined with Information lag is significant – e.g. RAA Loss Development Study started in the 1960s
  - Byproduct of underestimating the impact is **innocent capacity** by inexperienced companies
- Added company management, regulatory, and Solvency II pressure to establish benchmarking framework

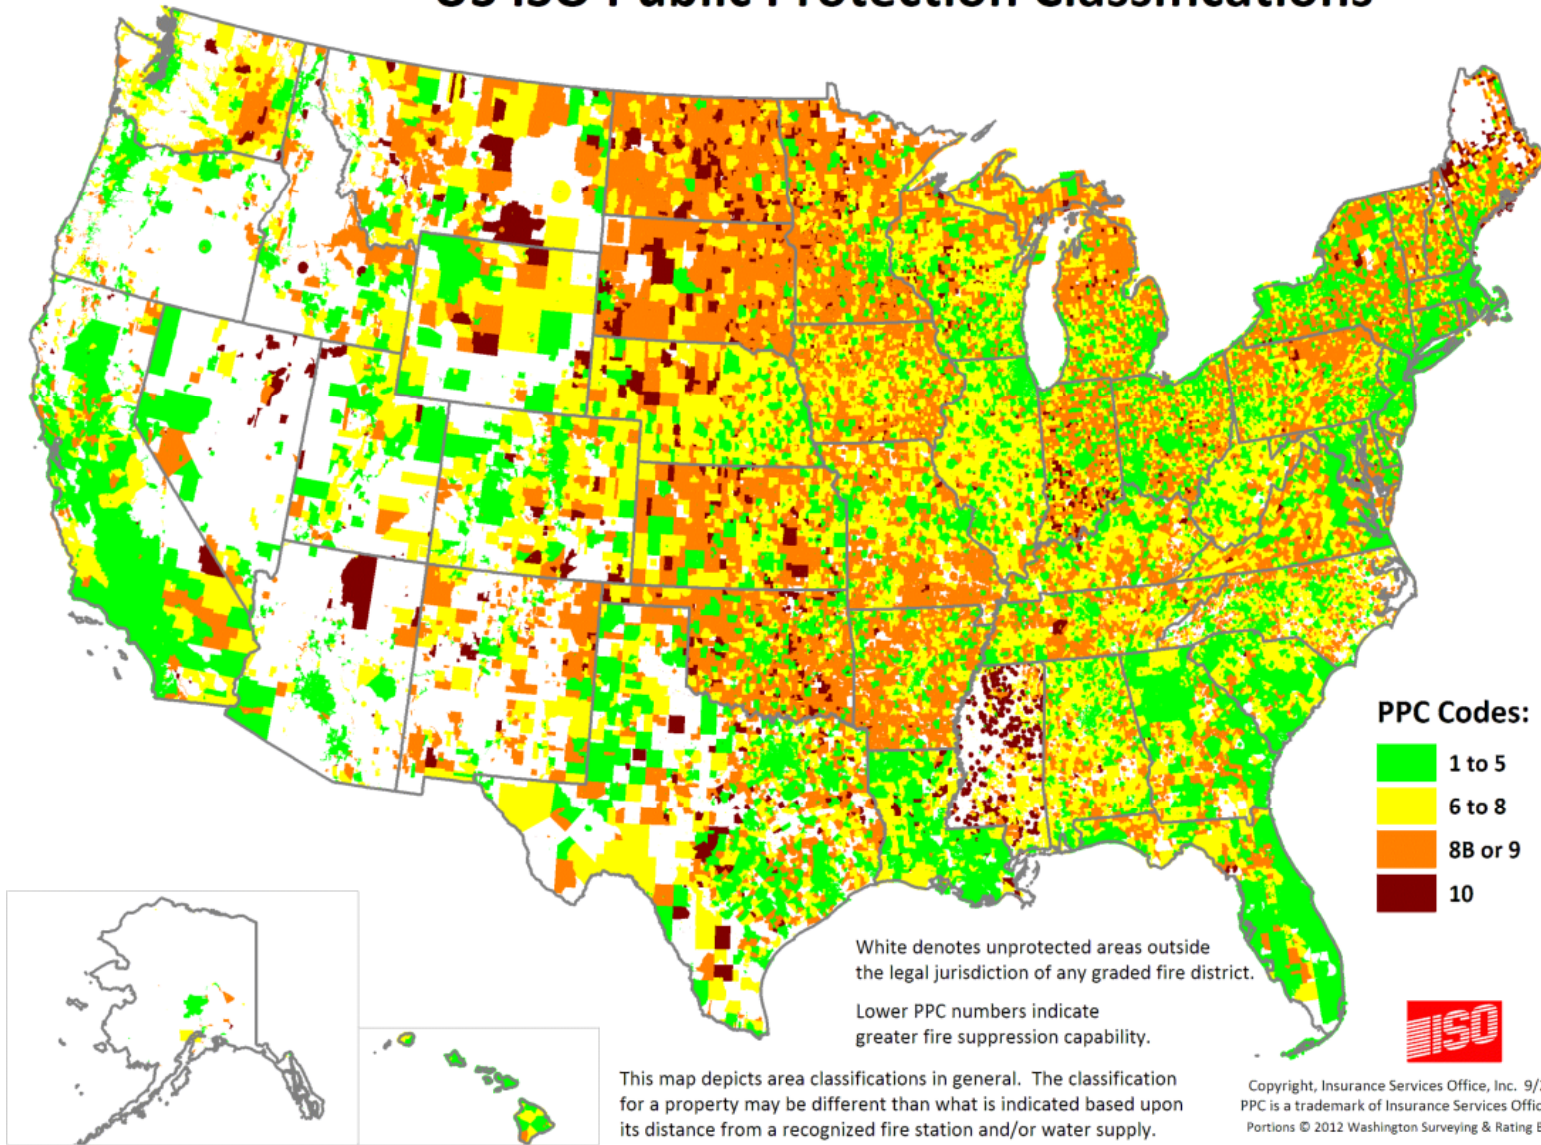

*Source: CARE-IT1 – June 2012; Perspectives from America – May 2012 by John Buchanan*

# PSOLD International – Countries

## ➤ 2013 Target Lines / Countries

- Further validate initial countries:
  - 4 initial: UK, Germany, France, Australia
  - Others in process: Brazil, Japan, Netherlands
- Other potential targets:
  - Belgium, China, Hong Kong, Ireland, Italy, Japan, Mexico, Switzerland, Turkey

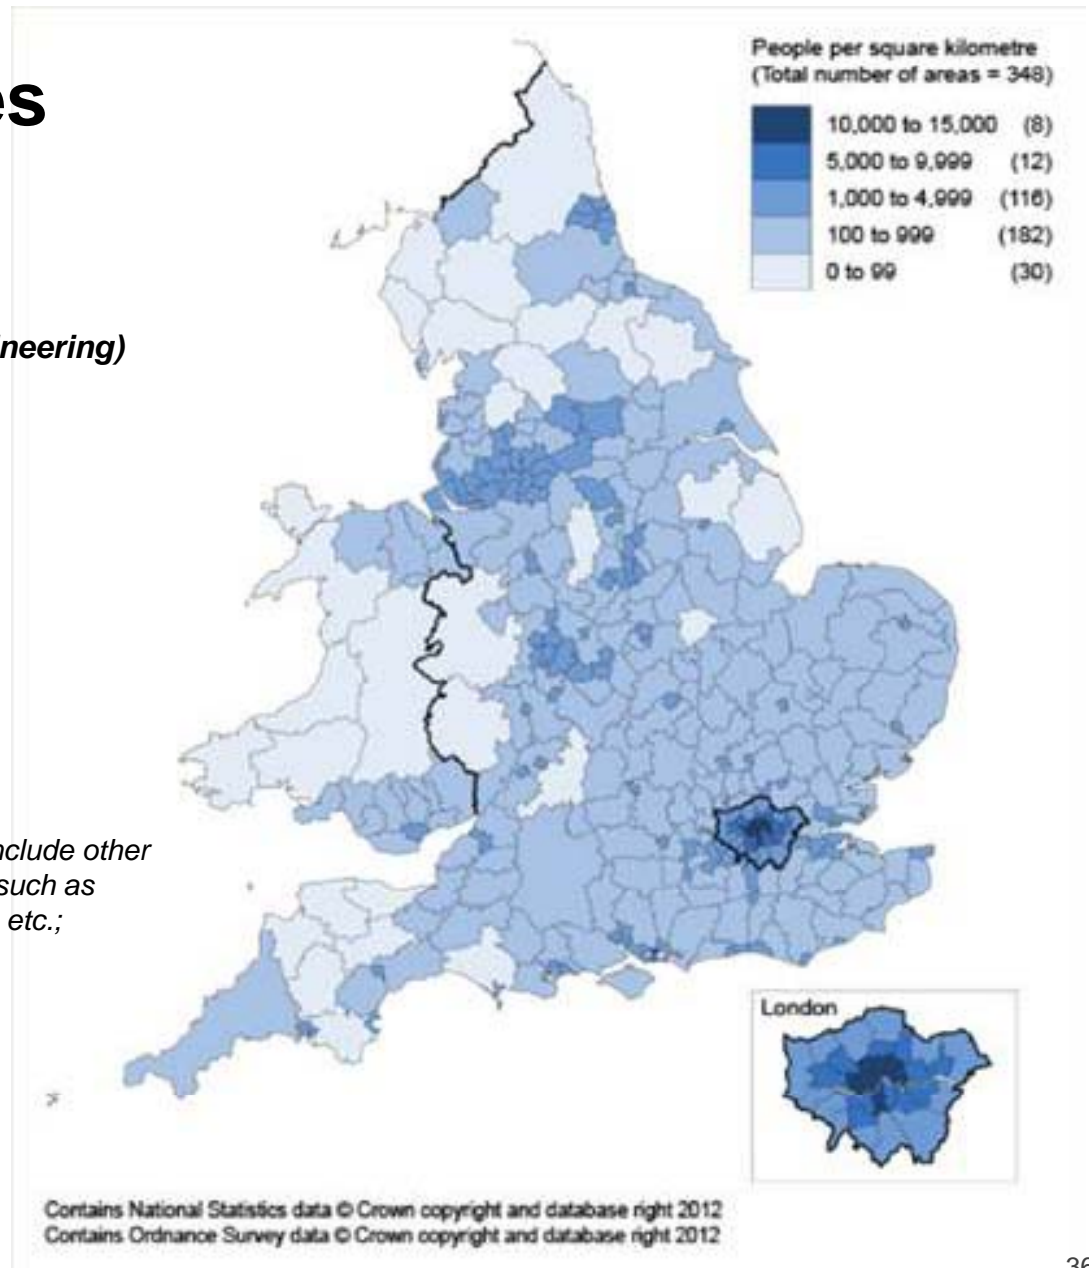

# US ISO Public Protection Classifications

# UK Protection Classes

- A. Major Cities *(and highly maintained fire engineering)*
- B. Other Cities
- C. Suburban
- D. Rural

*Distribute PPC Equivalents 1-10 (could be beyond 10); include other general expected fire protection engineering differences such as sprinkler usage / maintenance, industrial park pipe sizes, etc.;*

# PSOLD – Adjustments for Construction

## ISO Manual – Sample Loss Cost Page by Construction

| CSP Class Code | Coverage     | Construction (Code) |                     |               |                    |                                |       |

# Global Benchmarking – Data Collection

## ➤ Further Validate with Company Data Collection

- Market Size / concentration
- Submissions: individual large claims
- Aggregated exposure information
- Estimate actual and expected claim counts and ratios for various layers
- These ratios could be used to further scale up or down the US Proxy curves

# Application to International Risks

- **Start with ISO's advisory loss costs**
  - May be Used in ISO Occupancy Class Code Detail
  - May be Aggregated --- Mapped to AIR Level of Detail
  - Detailed Starting Point Available for US
    - Match Attributes of Risk
- **Employ COPE Adjustments**
  - Use Adjustments based on Comparisons with Other Countries
- **Supplement with Local/Risk Specific Knowledge**
- **Use Country-Specific PSOLD Curves (as previously described)**
- **Run Country-Specific CAT Model**

## Portal to ISO US Information

- **Provides ISO's advisory loss costs and Rating Factors**
  - Full Detail Available
  - State/National Averages Also Available
  - Available in level of detail used in CAT Modeling
- **Make appropriate adjustments for COPE (ARM)**
- **Primarily for Non-Admitted Market**
  - Updated twice yearly
- **Ease of Use**
  - Quick Access to Information
  - May be downloaded/exported

Sample 2010 PSOLD Curve Fit: All years, excl all cat, Buildings+contents+time element, 300% AOI cap

# Tripod Concepts

## Cat / Noncat - Verisk (ISO / AIR) Solution

# Ongoing Development

- **Enhanced Integration of Ground Up Loss Costs and Excess Layers**
  - Linkage of GULC and PSOLD excess factors
  - Extend GULC threshold from 10M up to 100M – 200M
- **Enhanced Scale Adjustment Factors (US and International application)**
  - Protection / Occupancies comparisons to defaults when using PCImport Facility
  - COPE and LOI enhancements
  - PSOLD and Ground Up Loss Costs
- **Integration with AIR Cat Models (2014)**
  - Combined Cat/Non-cat information
  - Location specific information on a combined basis
- **Portal to ISO US Information**
  - Updated twice a year
  - State and National Averages

**Questions ?**
