1

Antitrust Notice

- The Casualty Actuarial Society is committed to adhering strictly to the letter and spirit of the antitrust laws. Seminars conducted under the auspices of the CAS are designed solely to provide a forum for the expression of various points of view on topics described in the programs or agendas for such meetings.
- Under no circumstances shall CAS seminars be used as a means for competing companies or firms to reach any understanding – expressed or implied – that restricts competition or in any way impairs the ability of members to exercise independent business judgment regarding matters affecting competition.
- It is the responsibility of all seminar participants to be aware of antitrust regulations, to prevent any written or verbal discussions that appear to violate these laws, and to adhere in every respect to the CAS antitrust compliance policy.

Agenda

- Increasing use of catastrophe models in the commercial property casualty industry
- Understanding the importance of exposure data quality and robust financial modeling
- Advances in modeling business interruption insurance
- Understanding industrial facilities

3

Increasing Use of Catastrophe Models in the Commercial Property Casualty Industry

Catastrophe Modeling Framework

- Where are future events likely to occur?
- How intense are they likely to be?
- How frequently are they likely to occur?

5

Catastrophe Model Output Provides a Tool for Probabilistically Assessing and Managing Risk

- Models provide estimates of loss by event, location and coverage
- This allows determination of the full probability distribution of losses (EP curves)
- Ability to classify losses by:
 - Annual aggregate & occurrence losses
 - Direct, ceded and net retained loss
 - Location, policy, zone, territory and portfolio levels
 - Line of business, construction type, etc.
- Determination of robust risk measures such as TVar

6

Industry Trends in Adopting Catastrophe Modeling

In today's increasingly competitive market, the development & deployment of catastrophe models goes beyond an actuarial & statistical exercise

Market leaders are those organizations that take a holistic approach to catastrophe risk management. A fully integrated solution that supports the application of catastrophe model output at the point of decision making helps bridge the gap between the slow adopters & market leaders

- Models continue to provide an increasingly more accurate view of catastrophe risk and offer continually expanding functionality.
- Insurers that have successfully integrated catastrophe model output into their risk management practices are best positioned to leverage the advanced accuracy and expanded functionality of the models.

7

Integration of Catastrophe Models Across the Organization Support Risk Management Best Practices

- Identify areas to grow based on model-based risk metrics
- Perform model-based analyses to understand and manage the drivers of catastrophe risk

- Use model outputs in rate filings and in pricing of individual policies or programs

- Accumulation/risk-aggregation management
- Manage the impact of catastrophe risk on surplus
- Communicate with ratings agencies

- Use models to structure reinsurance treaties
- Use models to evaluate reinsurance purchases

- Advance planning, resource deployment, post-event communications

- Catastrophe model output used for risk selection and pricing at the point of sale

13

Identifying the Appropriate Construction and Occupancy Class Can Impact Loss Analyses

Underwriter receives submission with limited information:

- General commercial occupancy
- Unknown construction
- Replacement Cost: \$100 million

Example: ratio of loss for a contrived portfolio, when classifying portfolio as a particular construction class vs. identifying as "unknown"

©2011 AIR WORLDWIDE

CONFIDENTIAL: For the exclusive use of 2011 CAS Ratemaking and Product Management Seminar attendees

14

Lack of Detailed Data Can Lead to an Incomplete View of Risk

- Underwriter might collect additional information through available resources:
 - Commercial occupancy: Hotel (Temporary lodging)
 - Construction type: Steel

Variation within sub-classes of construction types highlights the need to accurately capturing detailed data

CONFIDENTIAL: For the exclusive use of 2011 CAS Ratemaking and Product Management Seminar attendees

15

Robust Exposure Data Tools Provide the Underwriter with the Most Complete View of Risk

- AIR's TruExposure™ enables the underwriter to validate and fill gaps in exposure data:
 - Validate replacement value and collect data on other primary risk characteristics such as year built, building height, etc.
 - Determine appropriate construction and occupancy classes
 - Identify secondary risk characteristics such as presence of a soft story

16

Commercial Policies can Have Complex Terms & Conditions

Deductibles

- At location level
 - By site: \$, %, % of loss
 - By coverage: \$ and %
 - Combined (Building, Other Structures, Contents): \$ and %
 - CEA Mini Policy: \$ and %
 - Franchise
- At policy level
 - Attachment point
 - Blanket, Minimum, Maximum
 - % of loss
 - Franchise

Limits

- At location level
 - By site or by coverage
- At policy level
 - Blanket, Excess, By coverage, Sublimits, First loss

Reinsurance

- Facultative reinsurance
 - Proportional
 - Non-proportional
 - Available at policy or individual locations
- Risk-based treaty reinsurance
 - Quota share
 - Surplus share
 - Per risk excess of loss
 - Includes special conditions
 - Line of business and region specific
 - Occurrence limits
 - Aggregate limits
- Portfolio (CAT) treaty reinsurance
 - Occurrence
 - Aggregate (stop loss)

17

A Probabilistic Approach is Required to Accurately Capture Policy Terms

- Commercial policy terms can be complex
- Defining and incorporating policy terms into catastrophe risk analyses improves the accuracy of modeled losses
- For instance, policy terms covering multiple coverages and location
 - Individual distributions need to be combined to arrive at the joint probability distribution of loss across
 - Coverages
 - Locations

19

Advances in Modeling Business Interruption Insurance

Discussion on Business Interruption (BI)

- BI from an underwriting perspective
 - Estimation of an insured's business income requirement
 - Complexity and variation in policy forms and coverages
 - Challenges in BI claims settlement
- BI exposure data
 - Data requirements
 - Exposure data analysis
- Modeling
 - Model variables
 - Model framework

Income and Expenses	Estimated 12 Month Policy Period Beginning:
A. Gross Sales See Note (A)	\$
B. DEDUCT:	
Prepaid Freight – Outgoing	- \$
Discounts, Returns & Allowances	- \$
Bad Debts & Collection Expenses	- \$
C. EQUALS: Net Sales	= \$
D. ADD: Other Earnings from your business operations (not royalties or investment income) See Note (D)	
Commissions or Rents	+ \$
Cash Discounts Received	+ \$
Other _____	+ \$
E. EQUALS: TOTAL REVENUES	= \$
F. DEDUCT: Total Cost of Goods Sold. This is NOT the GAAP figure. Calculate using worksheet below.	- \$
G. DEDUCT: Cost of services you purchase from outsiders to separately resell (e.g. service contracts), that do NOT continue under contract. Costs that continue are NOT deducted.	- \$
H. Are you Excluding OR Limiting "Ordinary Payroll" Expenses? If YES, DEDUCT: All "Ordinary Payroll" Expenses See Note (H) If NO, leave blank.	- \$
I. BUSINESS INCOME EXPOSURE FOR 12 MONTHS	= \$

21

Factors Contributing to Underinsurance in Business Interruption

- Use of business interruption limits for annual BI exposure
- Use of rules of thumb to determine BI limit rather than using BI worksheet for each location
- Underestimation of number of locations that can get damaged in a catastrophe
- Business interruption findings from Independent Insurance studies
 - Businesses either do not have BI coverage or do not have the information to estimate BI exposure
 - Significant underestimation of business downtime (<3 months) to determine BI Limits

23

Robust Approach to Modeling Business Interruption Captures Insured Downtime Following a Loss

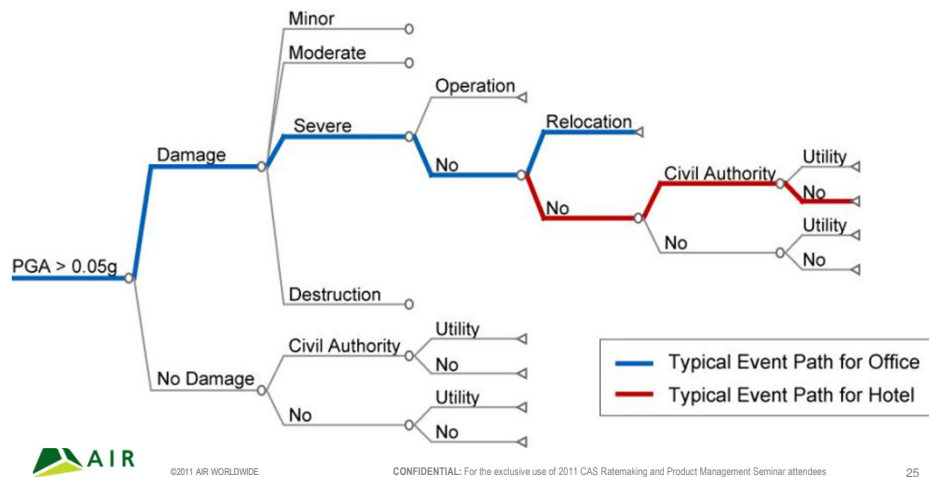

©2011 AIR WORLDWIDE

CONFIDENTIAL: For the exclusive use of 2011 CAS Ratemaking and Product Management Seminar attendees

24

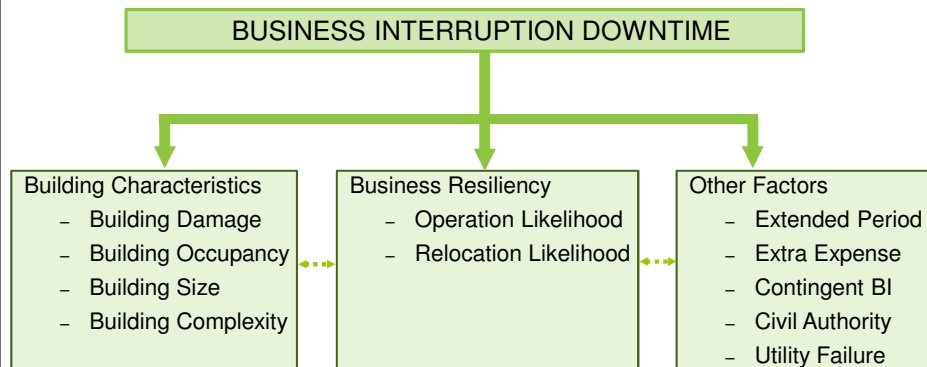

AIR's Models Use an Event Tree Approach to Handle Business Interruption

- Event Tree approach
- Function of building damage and occupancy class

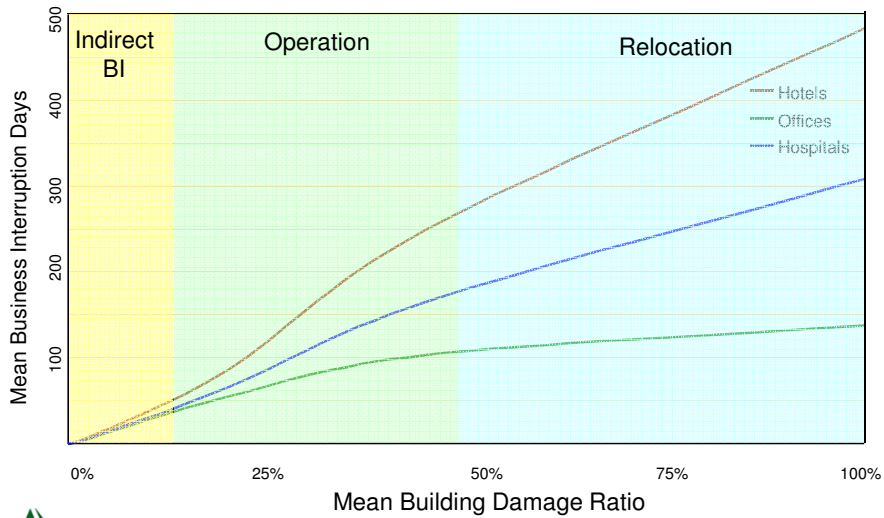

Key Factors Used in Determining Business Interruption Downtime

Downtime is Influenced by Both Building Complexity and Content Types

A Robust Business Interruption Model Should Incorporate the Impact of Various Factors by Occupancy

©2011 AIR WORLDWIDE

CONFIDENTIAL: For the exclusive use of 2011 CAS Ratemaking and Product Management Seminar attendees

27

Business Interruption Losses Can Vary Significantly for the Same Level of Building Damage

Claim # 1
Building Sustained Minor Damage
5 Days of Business Interruption

- Lawyers, accountants, and consultants working in an office building are able to relocate to another of their firms facilities, sustaining very little Business Interruption losses

Claim # 2
Building Sustained Minor Damage
37 Days of Business Interruption

- Although the Hospital only sustained minor damage, it could not be re-opened until all the health concerns were fully remediated

28

Advances in Modeling Business Interruption Insurance

- Business interruption accounts of downtime
- Modeling can capture both direct & contingent BI
- AIR's modeling framework allows for the development of separate downtime functions for different types of businesses (occupancies)
- Quality of exposure data varies significantly across the industry: detailed business interruption policy conditions and property conditions are often not available
 - AIR's methodology to modeling business interruption losses employs logical assumptions about the occupancy and building characteristics of "typical" BI policy

29

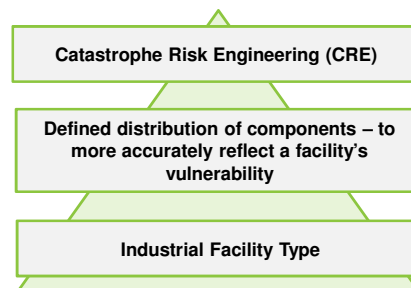

Understanding Industrial Facilities

Complexity and Diversity of Industrial Facilities Creates Additional Challenges to the Underwriting Process

- A site can be very large with very different industrial plants in its interior
- Examples of Industrial facility classes
 - Chemical plants
 - Petrochemical plants
 - Power generation and distribution systems
 - Manufacturing plants
- In addition, plants may be comprised of many different components - each of very different vulnerability

Analysis of a facility's catastrophe risk exposure can depend on the carrier's sophistication & experience in underwriting industrial facilities

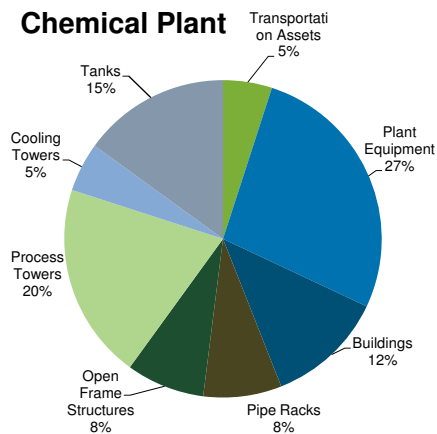

©2011 AIR WORLDWIDE

31

Percentage (by Value) of Component Class Varies with Industrial Facility Type

Chemical Plant

Ethanol Plant

©2011 AIR WORLDWIDE

CONFIDENTIAL: For the exclusive use of 2011 CAS Ratemaking and Product Management Seminar attendees

32

Defining the Component-Mix of a Facility Helps to Ensure the Most Accurate Assessment of the Vulnerability

- A Component-based approach to modeling a facility's damageability should consider the vulnerability of assets comprising the facility
- In cases where the facility's component-mix doesn't match a standard industrial facility type – underwriters must input the facility's distribution of components – in order to accurately assess vulnerability

Transformer

Cooling Towers

Vertical Vessels

33

Identifying Major Component Classes Within Industrial Facilities

Example: Chemical plant

Component Class	Subclass
1. Transportation Assets	1 = Docks
	2 = Loading Structure
	3 = Freight Cars
	4 = Rails
	5 = Pavement
2. Plant Equipment	1 = Pumps
	2 = Air Condensers
	3 = Generators
	4 = Transformers
	5 = Rectifiers
	6 = Chlorine Cells
	7 = Compressor
	8 = Furnace
	9 = Motors
	10 = Gas Turbines
	11 = Process Control Equipment
	12 = Analyzer
	13 = Elect HV Circuit Bk
	14 = substations
	15 = switching stations
3. Buildings	1=MCC Building/CMU Construction
	2=Control/office Building/Concrete Construction
	3=Warehouse Building/ Metal Building
	4=Maintenance Building/Metal Building

Component Class	Subclass
4. Pipe Racks	1 = Old Structures
	2 = New Structures
5. Open Frame Structures	1 = Braced
	2 = Unbraced
6. Flares	1 = Free standing
	2 = Guyed
	3 = Derrick
7. Process Towers	1 = All
8. Cooling Towers	1 = Wood frame
	2 = Concrete
	3 = Composite Fiber
9. Tanks	1 = Unanchored
	2 = Anchored
	3=HD Range
	4=Fill ratio
10. Utility Structures	1 = Single Wood Pole
	2 = Two-pole wood
	3 = Three-pole wood
	4 = Lattice Pole (transmission tower)
	5 = Tubular Steel Pole
	6 = Steel Dead-end Pole

34

Summary

- Leading companies are integrating catastrophe modeling into their underwriting process for better decisions
- A range of data and techniques are available to provide increasing precision in risk differentiation
- Catastrophe risk is influenced by factors other than simple hazard metrics
- Proper capture of building characteristics and business interruption risk can significantly impact loss estimates
- Component approach improves modeling of Industrial Facilities
