

PM-11 Predictive Modeling
Data Mining vs Statistical Analysis

A presentation for 2011 CAS RPM Seminar
By Serhat Guven, FCAS, MAAA

March 22, 2011

Agenda

- Background
- Predictive Modeling Techniques
- Predictive Modeling for Insurance
- Conclusion

towerswatson.com

Background

- Purpose of modeling is to separate the signal from the noise

$$\text{Response Variable} = \text{Systematic Component} + \text{Random Component}$$

Signal:
Function of the Rating Factors/Predictors

Noise:
Reflects stochastic process

- Goals of a model
 - Predictive accuracy
 - Explanatory power
 - Individual parameter importance
 - Interactions among parameters

Background

- Types of Predictive Models
 - Descriptive
 - Summarization of data in convenient ways to increase understanding
 - Classification
 - Prediction of a categorical unknown value of a variable (response) given the known values of other variables (predictors)
 - Regression
 - Prediction of a continuous unknown value of a variable (response) given the known values of other variables (predictors)

Background

- Alternate taxonomies of predictive models
 - Parametric vs. Nonparametric
 - Parametric: a fitted value is described by a functional relationship applied to specific parameters
 - Nonparametric:
 - Techniques that do not rely on data belonging to any specific distribution
 - Structure of the model is not fixed and grows as the complexity of the data grows
 - Supervised vs. Unsupervised Learning
 - Supervised: training data consists of predictors and responses
 - Unsupervised: training data consists of predictors only

Background

- Components of a predictive model

$$\text{Response Variable} = \text{Systematic Component} + \text{Random Component}$$

- Model structure
 - Determines the functional relationship between the predictors and response
- Score function
 - Quantifies the relationship between the model structure and the actual data
- Optimization Strategy
 - Calculate the resulting parameters

Background

- Predictive modeling for insurance

```

    graph LR
      RawData[Raw Data] --> Model[Model]
      Model --> Signal[Signal]
      Model --> Noise[Noise]
      Signal --> Rates[Rates]
      Signal --> Rules[Rules]
  
```

- Rates
 - Require parametric structure
 - Exceptions include boundaries, symboling, other high dimensional constructs
- Rules
 - Tier and company placement can be more tree based
- Residual analysis provide the framework

towerswatson.com 7

Predictive Modeling Techniques

Principle Component Analysis

- Goal: Identify a smaller number of dimensions as combinations of the original dimensions
- Components
 - Model Structure
 - Let Z be an $n \times c$ matrix of principle components where $Z = X\mu$
 - Such that μ is a $p \times c$ eigenvector matrix
 - Score Function
 - Find m such that $\text{Var}(Z)$ is maximized subject to the constraint that $\mu^T \mu = 1$
 - Optimization Strategy
 - Solve the following systems of equations $R\mu = \lambda\mu$
 - Where R is the correlation matrix and λ is the eigenvalue
- Taxonomy – descriptive & unsupervised

towerswatson.com 8

Predictive Modeling Techniques

Principle Component Analysis

- Example: external geodemographic data

GEO. UNIT	GEO. POP. DENSITY	GEO. MED. AGE	GEO. UNEMP.
A	100,000	34	5%
B	50,000	55	6%
...

 \times

GEO.	PC1	PC2	PC3
GEO_POP_DENSITY	1.50	0.75	0.68
GEO_MED_AGE	0.40	1.20	0.34
GEO_UNEMP	2.00	3.00	1.50

GEO. UNIT	PC1 SCORE	PC2 SCORE	PC3 SCORE
A	150,013	75,040	68,011
B	75,022	37,566	34,018
...

towerswatson.com 9

Predictive Modeling Techniques

Principle Component Analysis

- Advantages
 - Scores are independent of each other
 - Models can use significantly fewer score dimensions than geo dimensions
 - Coefficients can be used to select similar geo
- Disadvantages
 - Interpretative
 - Implementation

10

Predictive Modeling Techniques

Clustering

- Goal: Produce predictive groupings that minimize within group heterogeneity while maximizing cross group heterogeneity
- Components
 - Model Structure
 - Given a set of data points find clusters such that each data point is assigned to a unique cluster
 - Score Function
 - Minimize within cluster heterogeneity and maximize the between cluster variation where variation is based on 'distance'
 - Optimization Strategy
 - Combinatorial optimization (allocate n objects into k classes)
 - Iterative heuristic search mechanisms
- Taxonomy – descriptive & both supervised and unsupervised

11

Predictive Modeling Techniques

Clustering

- Example: bucketing vehicles units into profile groups based on similarities in vehicle characteristics
- Advantages
 - Non parameteric
 - Interpretive
 - Data controls
- Disadvantages
 - Heavily dependent on choice of score functions
 - Difficult to incorporate dimensional contiguity constraints
 - Difficult to gauge success of clustering routine

12

Predictive Modeling Techniques

Spatial Analysis

- Goal: fitted values follow the principle of locality
- Components
 - Model Structure
 - Neighboring structure
 - Score Function
 - Bayesian applications distribution analysis
 - Optimization Strategy
 - Search routine
- Taxonomy – descriptive & supervised

Predictive Modeling Techniques

Spatial Analysis

- Examples
 - Geographic smoothing
 - Vehicle symboling
- Advantages
 - No requirement to select a distribution
 - Non parametric solution for high dimensional variables
- Disadvantages
 - Difficult to judge the appropriateness of the smoothing function
 - Interpretive challenges for non geographic components

Predictive Modeling Techniques

Classification and Regression Trees

- Goal: Identify importance of individual factors and/or determine whether localized models should be constructed
- Components
 - Model Structure
 - Decision Tree
 - Score Function
 - Cross Validation: Builds tree on training data and estimates misclassification on validation data
 - Different sets of training and validation data used to develop overall misclassification rate
 - Optimization Strategy
 - Greedy search over structures: recursively expands tree and prunes limbs.
- Taxonomy – classification/regression & supervised

towerswatson.com 15

Predictive Modeling Techniques

Classification and Regression Trees

- Example: indicating localization strategies

- Significantly different branch structure suggests data split and model localization

Predictive Modeling Techniques

Classification and Regression Trees

- Advantages
 - Easy to understand
 - No prior assumptions about the data (non parametric)
 - Able to process numerical and categorical data
- Disadvantages
 - Tree structure is unstable
 - Can be overly complex
 - Prediction can create irregularities in continuity

Predictive Modeling Techniques

Regression Techniques (Generalized Linear and Nonlinear Models)

- Goal: predication of an unknown response given the known values of the predictors
- Components
 - Model Structure
 - Functional relationship between the mean and variance
 - Link function applied to a combination of parameters
 - Score Function
 - Likelihood and quasi likelihood functions
 - Optimization Strategy
 - Maximize likelihood function
 - Newton Raphson routine
- Taxonomy – regression & supervised

Predictive Modeling Techniques

Generalized Linear and Nonlinear Models

- Examples
 - Loss cost modeling
 - Demand modeling
- Advantages
 - Closed form solution
 - Interpretive ease
 - Transparency
 - Robust in dealing with bad/missing data
- Disadvantages
 - Specification of the mean-variance function difficult to validate
 - High dimensional data vectors

Predictive Modeling Techniques

Regression Techniques (Neural Networks)

- Goal: predication of an unknown response given the known values of the predictors
- Components
 - Model Structure
 - Recursive logit link function
 - Score Function
 - Sum of squared error
 - Optimization Strategy
 - Newton Raphson routine
- Taxonomy – regression & supervised

Predictive Modeling Techniques

Neural Networks

- Examples
 - Loss cost modeling
 - Demand modeling
- Advantages
 - No requirement to select a distribution
 - Robust model form to identify more complex structures
- Disadvantages
 - Tends to overfit
 - Responds less well to bad data
 - Interpretive challenges

Predictive Modeling for Insurance

- Predictive modeling for insurance

```
graph LR; RD[Raw Data] --> M[Model]; M --> S[Signal]; M --> N[Noise]; S --> R[Rules]; S --> RA[Rates];
```

- Need for a blend of parametric and non parametric techniques
 - Regulatory environment as well as consumer understanding requires a clean parametric solution
 - Ability to properly reflect the differences in loss costs with more complex interaction concepts

towerswatson.com © 2010 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only. 22

Predictive Modeling for Insurance

- Blending approaches – a study of residuals

```
graph LR; RD[Raw Data] --> TPM[Traditional Parametric Model]; TPM --> S[Signal]; TPM --> N[Noise]; N --> ML[Machine Learning]; ML --> R[Rules]; ML --> RA[Rates]; S --> R; S --> RA;
```

- Residual modeling is useful when controlled

towerswatson.com © 2010 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only. 23

Predictive Modeling for Insurance

- What about this alternative?

```
graph LR; RD[Raw Data] --> ML[Machine Learning]; ML --> S[Signal]; ML --> N[Noise]; S --> PM[Parametric Model]; PM --> R[Rules]; PM --> RA[Rates];
```

- The machine can grow the signal in the wrong direction thereby influencing the rates/rules
- Difficult to trust the fitted values from the machine

towerswatson.com © 2010 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only. 24

Predictive Modeling for Insurance

- Spatial Correction
 - Residual signal used to adjust score from the multivariate model

towerswatson.com

© 2010 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only.

Predictive Modeling Methods

- Spatial Smoothing Methods
 - Uses knowledge of surrounding areas to enhance estimates of the underlying risk in each area based on "Principle of Locality".
- Distance based methods
 - Simpler to implement and interpret
 - Does not consider natural boundaries
 - May over smooth urban areas and under smooth rural areas
- Adjacency based methods
 - Distribution assumptions allow prior knowledge of claims
 - Distance can still be incorporated
 - Considers natural boundaries

towerswatson.com

Predictive Modeling for Insurance

- Neighboring vehicles: instead of using latitude/longitude to build adjacency relationships, use vehicle dimensions

- Once neighbors are determined similar techniques used for territorial analysis can be applied

towerswatson.com

Predictive Modeling for Insurance

- Super profiling
 - Use alternate machine learning techniques to model the residual
 - CARTs
 - Neural Networks
 - Adaptive Networks
 - Etc
- Advantages
 - Very specific customer classes that could only be captured with several layers of scoring or with deep interaction terms
- Disadvantages
 - No clear explanatory effect of the structural output

28

Conclusion

- Variety of predictive modeling techniques are available to analysts
 - Different forms are useful for different situations
 - Consider the taxonomy and structure of each form
- Modeling loss costs should use a combination of parametric and non parametric methods
 - Parametric methods used the core rate algorithm'
 - Nonparametric methods used more for the rules
- Alternate modeling techniques should be applied to the residual
 - Allows greater control of the resulting model form
 - Over reliance of machine learning methods tend to overfit the data and should be further controlled to specific factors
