Price optimization

Inputs Sound inputs are critical

Optimization Algorithm Important to have practical optimization approach which pays due regard to long term value

Outputs Practical and phased implementation

Elasticity modeling - a rigorous approach

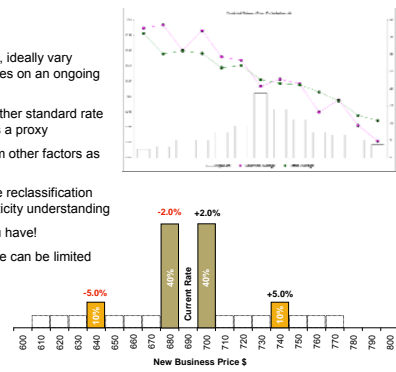

Risks

Retention rate increasing as premium increases

Price trials

- In deregulated markets, ideally vary random sample of quotes on an ongoing basis
- In regulated markets, other standard rate changes need to act as a proxy
- Best to decorrelate from other factors as much as possible
- Geographical or vehicle reclassification can yield valuable elasticity understanding
- But, you have what you have
- If range is limited, scope can be limited

Elasticity modelling without price tests

- It is possible to capture some elasticity variation just from undesigned historic price changes

Modeling elasticity vs demand

- Y-variate still "did they buy, yes/no"
- Focus on price related explanatory variables different
- Can re-express as elasticity by wobbling price explanatory variables after fitting model

What do we mean by "price elasticity"?

- Most people define elasticity as
 - Percentage change in demand / percentage change in price
 - "Classical elasticity"
 - Definition found in economics textbooks
- But sometimes ...
 - Percentage point change in demand / percentage change in price
 - "Delta elasticity"
- Or ...
 - Absolute change in linear predictor / percentage change in price
 - "Linear predictor elasticity"
 - Doesn't vary with demand

What does logit imply about elasticity?

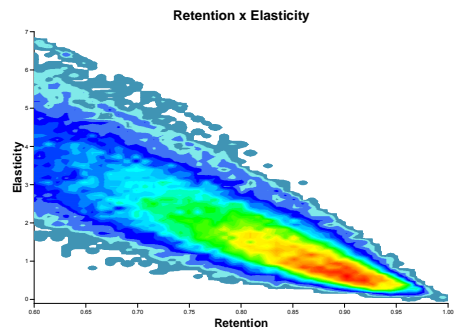

- If there are *no interactions with price change factors*

Generalized non-linear models

- Many forms, one of which is:

$$y = \frac{1}{1 + \exp(-X\beta + \underbrace{\Delta P e^{z_x}}_{\text{Term forces elasticity to be positive}})} + \text{error}$$

Balancing profit and volume

- Can optimize
 - profit for a particular volume, or
 - volume for a particular profit
- over a defined time horizon
- Try different options to understand different balances available
- Generates efficient frontier which aids understanding of target selection

Example profitability constraint

(Contents not available in handout)

- Constraining profit loads inhibits ability to drive profit uplift(!)
- This is the "natural" dimension of uplift for an inelastic portfolio
- Constraint cedes a large percentage (65%) of potential profit uplift measured at constant retention
- Cedes around 58% of potential retention rate uplift, at constant profit load uplift

Optimization Process

- Maximum performance lift
- Not feasible for pricing
- Useful for other decisions

- Optimal within rate plan constraint
- Simple to complex
- Easier to communicate and manage

Why not optimize the ratebook directly?

- Methods exist which allow direct optimization of ratebook form
- Does not improve of approach of modeling individually optimized rates
- Does not show loss of potential lift
- Modeling individually optimized rates indicates when new factors/scores should be considered

US regulatory constraints

- "Rates shall not be excessive, inadequate, or unfairly discriminatory"
- "A rate is not unfairly discriminatory because it is based in part upon the establishment or modification of classifications of risks based upon:
 - (1) the size of the risk
 - (2) the expense or difficulty in management of the risk,
- ...
- Reasonable range
- Reduction in complaints

Other examples

- Company A improved its private auto new business predicted **loss ratio** by **3%** at constant conversion rate
- Company B had **20%** increase in auto **new business** at constant profitability
- Company C improved **loss ratio** of direct auto business by **1½%** at constant volume, against a control group. Numerous additional benefits cited by company
- Company D optimised its pricing of telesales direct new business: improving predicted **loss ratio** by around **2%**, whilst increasing actual converted business **volumes** by around **6%**
- Distributor E increased its **commission income** by more than **£10 million** per annum
- Distributor F improved its aggregator-sourced private car **conversion rate** by a more than **10%**, at constant unit profitability per sale
