## Antitrust Notice

- The Casualty Actuarial Society is committed to adhering strictly to the letter and spirit of the antitrust laws. Seminars conducted under the auspices of the CAS are designed solely to provide a forum for the expression of various points of view on topics described in the programs or agendas for such meetings.
- Under no circumstances shall CAS seminars be used as a means for competing companies or firms to reach any understanding – expressed or implied – that restricts competition or in any way impairs the ability of members to exercise independent business judgment regarding matters affecting competition.
- It is the responsibility of all seminar participants to be aware of antitrust regulations, to prevent any written or verbal discussions that appear to violate these laws, and to adhere in every respect to the CAS antitrust compliance policy.

### Building predictive models is a multi-step process

```

    graph LR
      A[Set project goals and review background] --> B[Gather and prepare data]
      B --> C[Explore Data]
      C --> D[Build Component Predictive Models]
      D --> E[Validate Component Models]
      E --> F[Combine Component Models]
      F --> G[Incorporate Constraints]
  
```

- Ernesto walked us through the first 3 components
- We will now go through an example of the remaining steps:
  - Building component predictive models
    - We will illustrate how to build a frequency model
  - Validating component models
    - We will illustrate how to validate your component model
  - We will also briefly discuss combining models and incorporating implementation constraints
    - Goal should be to build best predictive models now and incorporate constraints later

---

---

---

---

---

---

---

---

---

---

## Building component predictive models can be separated into two steps

- Initial Modeling
  - Selecting error structure and link function
  - Build simple initial model
  - Testing basic modeling assumptions and methodology
- Iterative modeling
  - Refining your initial models through a series of iterative steps complicating the model, then simplifying the model, then repeating

3

---

---

---

---

---

---

---

---

---

---

---

---

## Initial modeling

- Initial modeling is done to test basic modeling methodology
  - Is my link function appropriate?
  - Is my error structure appropriate?
  - Is my overall modeling methodology appropriate (e.g. do I need to cap losses? Exclude expense only claims? Model by peril?)

4

---

---

---

---

---

---

---

---

---

---

---

---

## Examples of error structures

- Error functions reflect the variability of the underlying process and can be any distribution within the exponential family, for example:

• Gamma consistent with severity modeling; may want to try Inverse Gaussian

• Tweedie consistent with pure premium modeling

• Poisson consistent with frequency modeling

• Normal, useful for a variety of applications

5

---

---

---

---

---

---

---

---

---

---

---

---

### Generally accepted error structure and link functions

- Use generally accepted standards as starting point for link functions and error structures

Observed Response	Most Appropriate Link Function	Most Appropriate Error Structure	Variance Function
--	--	Normal	$\mu^2$
Claim Frequency	Log	Poisson	$\mu^1$
Claim Severity	Log	Gamma	$\mu^2$
Claim Severity	Log	Inverse Gaussian	$\mu^3$
Pure Premium	Log	Gamma or Tweedie	$\mu^7$
Retention Rate	Logit	Binomial	$\mu(1-\mu)$
Conversion Rate	Logit	Binomial	$\mu(1-\mu)$

6

---

---

---

---

---

---

---

---

---

---

---

---

### Build an initial model

- Reasonable starting points for model structure
  - Prior model
  - Stepwise regression
  - General insurance knowledge
  - CART (Classification and Regression Trees) or similar algorithms

© 2013 Towers Watson. All rights reserved.

7

---

---

---

---

---

---

---

---

---

---

---

---

### Test model assumptions

- Plot of all residuals tests selected error structure/link function

© 2013 Towers Watson. All rights reserved.

8

---

---

---

---

---

---

---

---

---

---

---

---

**Example: initial frequency model**

- Link function: Log
- Error structure: Poisson
- Initial variable selected based on industry knowledge:
  - Gender
  - Driver age
  - Vehicle value
  - Area (territory)
- Variable NOT in initial model:
  - Vehicle body
  - Vehicle age

© 2013 Towers Watson. All rights reserved.

9

---

---

---

---

---

---

---

---

---

---

---

---

**Example: initial frequency model**

- Link function: Log
- Error structure: Poisson
- Initial variable selected based on industry knowledge:
  - Gender
  - Driver age
  - Vehicle value
  - Area (territory)
- Variable NOT in initial model:
  - Vehicle body
  - Vehicle age

© 2013 Towers Watson. All rights reserved.

10

---

---

---

---

---

---

---

---

---

---

---

---

**Example: initial frequency model**

- Link function: Log
- Error structure: Poisson
- Initial variable selected based on industry knowledge:
  - Gender
  - Driver age
  - Vehicle value
  - Area (territory)
- Variable NOT in initial model:
  - Vehicle body
  - Vehicle age

© 2013 Towers Watson. All rights reserved.

11

---

---

---

---

---

---

---

---

---

---

---

---

**Example: initial frequency model**

- Link function: Log
- Error structure: Poisson
- Initial variable selected based on industry knowledge:
  - Gender
  - Driver age
  - Vehicle value
  - Area (territory)
- Variable NOT in initial model:
  - Vehicle body
  - Vehicle age

12

---

---

---

---

---

---

---

---

---

---

**Example: initial frequency model - residuals**

- Frequency residuals are hard to interpret without 'Crunching'
- Two clusters:
  - Data points with claims
  - Data points without claims

13

---

---

---

---

---

---

---

---

---

---

**Example: initial frequency model - residuals**

- Order observations from smallest to largest predicted value
- Group residuals into 500 buckets
- The graph plots the average residual in the bucket
- Crunched residuals look good!

14

---

---

---

---

---

---

---

---

---

---

### Iterative Modeling

- Initial models are refined using an iterative modeling approach
- Iterative modeling involves many decisions to complicate and simplify the models
- Your modeling toolbox can help you make these decisions
  - We will discuss your tools shortly

---

---

---

---

---

---

---

---

### Ideal Model Structure

- To produce a sensible model that explains recent historical experience and is likely to be predictive of future experience

---

---

---

---

---

---

---

---

### Your modeling tool box

- Model decisions include:
  - Simplification: excluding variables, grouping levels, fitting curves
  - Complication: including variables, adding interactions
- Your modeling toolbox will help you make these decisions
- Your tools include:
  - Parameters/standard errors
  - Consistency of patterns over time or random data sets
  - Type III statistical tests (e.g., chi-square tests, F-tests)
  - Balance tests (i.e. actual vs. expected test)
  - Judgment (e.g., do the trends make sense?)

---

---

---

---

---

---

---

---

**Modeling toolbox: judgment**

Modeled Frequency Relativity – Vehicle Value

- The modeler should also ask, 'does this pattern make sense?'
- Patterns may often be counterintuitive, but become reasonable after investigation
- Uses:
  - Inclusion/exclusion
  - Grouping
  - Fitting curves
  - Assessing interactions

© 2013 Towers Watson. All rights reserved.

18

---

---

---

---

---

---

---

---

**Modeling toolbox: balance test**

Actual vs. Expected Frequency - Vehicle Age

- Balance test is essentially an actual vs. expected
- Can identify variables that are not in the model where the model is not in 'balance'
  - Indicates variable may be explaining something not in the model
- Uses:
  - Inclusion

© 2013 Towers Watson. All rights reserved.

19

---

---

---

---

---

---

---

---

**Modeling toolbox: parameters/standard errors**

Modeled Frequency Relativities With Standard Errors - Vehicle Body

- Parameters and standard errors provide confidence in the pattern exhibited by the data
- Uses:
  - Horizontal line test for exclusion
  - Plateaus for grouping
  - A measure of credibility

© 2013 Towers Watson. All rights reserved.

20

---

---

---

---

---

---

---

---

**Modeling toolbox: consistency of patterns**

- Checking for consistency of patterns over time or across random parts of a data set is a good practical test

- Uses:
  - Including/excluding factors
  - Grouping levels
  - Fitting curves
  - Adding Interactions

© 2013 Towers Watson. All rights reserved.

21

---

---

---

---

---

---

---

---

---

---

---

---

**Modeling toolbox: type III tests**

- Chi test and/or F-Test is a good statistical test to compare nested models
  - $H_0$ : Two models are essentially the same
  - $H_1$ : Two models are not the same
  - Principle of parsimony: If two models are the same, choose the simpler model

- Uses:
  - Inclusion/exclusion

Chi-Square Percentage	Meaning	Action*
<5%	Reject $H_0$	Use More Complex Model
5%-15%	Grey Area	???
15%-30%	Grey Area	???
>30%	Accept $H_0$	Use Simpler Model

22

---

---

---

---

---

---

---

---

---

---

---

---

**Example: frequency model iteration 1 – simplification**

- Modeling decision: Grouping Age Category and Area
- Tools Used: judgment, parameter estimates/std deviations, type III test

© 2013 Towers Watson. All rights reserved.

23

---

---

---

---

---

---

---

---

---

---

---

---

**Example: frequency model iteration 1 – simplification**

- Modeling decision: fitting a curve to vehicle value
- Tools used: judgment, type III test, consistency test

---

---

---

---

---

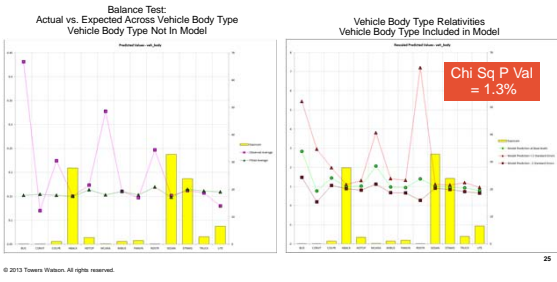

---

---

---

**Example: frequency model iteration 2 – complication**

- Modeling decision: adding vehicle body type
- Tools used: balance test, parameter estimates/std deviations, type III test

---

---

---

---

---

---

---

---

**Example: iterative modeling continued....**

- Iteration 3 - simplification
  - Group vehicle body type
- Iteration 4 – complication
  - Add vehicle age
- Iteration 5 – simplification
  - group vehicle age levels

---

---

---

---

---

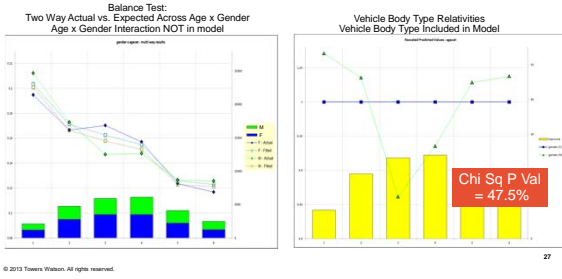

---

---

---

**Example: frequency model iteration 6 – complication**

- Action: adding age x gender interaction
- Tools used: balance test, type III test, consistency test, judgment

---

---

---

---

---

---

---

---

---

---

---

---

**Predictive models must be validated to have confidence in the predictive power of the models**

- Model validation techniques include:
  - Examining residuals
  - Examining gains curves
  - Examining hold out samples
    - Changes in parameter estimates
    - Actual vs. expected on hold out sample
- Component models and combined risk premium model should be validated

---

---

---

---

---

---

---

---

---

---

---

---

**Model validation: residual analysis**

- Recheck residuals to ensure appropriate shape

- Crunched residuals are symmetric
- For Severity - Does the Box-Whisker show symmetry across levels?

---

---

---

---

---

---

---

---

---

---

---

---

**Model validation: lift charts on hold out data**

- Actual vs. expected on holdout data is an intuitive validation technique
- Good for communicating model performance to non-technical audiences
- Can also create actual vs. expected across predictor dimensions

© 2013 Towers Watson. All rights reserved.

33

---

---

---

---

---

---

---

---

---

---

**Component frequency and severity models can be combined to create pure premium models**

- Component models can be constructed in many different ways
  - The standard model:

© 2013 Towers Watson. All rights reserved.

34

---

---

---

---

---

---

---

---

---

---

**Building a model on modeled pure premium**

- When using modeled pure premiums, select the gamma/log link (not the Tweedie)

- Modeled pure premiums will not have a point mass at zero

- Raw pure premiums are bimodal (i.e., have a point mass at zero) and require a distribution such as the Tweedie

© 2013 Towers Watson. All rights reserved.

35

---

---

---

---

---

---

---

---

---

---

### Various constraints often need to be applied to the modeled pure premiums

**Goal:** Convert modeled pure premiums into indications after consideration of internal and external constraints

- Not always possible or desirable to charge the fully indicated rates in the short run
  - Marketing decisions
  - Regulatory constraints
  - Systems constraints
- Need to adjust the indications for known constraints

36

---

---

---

---

---

---

---

---

---

---

### Constraints to give desired subsidies

- Offsetting one predictor changes parameters of other correlated predictors to make up for the restrictions
  - The stronger the exposure correlation, the more that can be made up through the other variable
  - Consequently, the modeler should not refit models when a desired subsidy is incorporated into the rating plan

	Insurer-Desired Subsidy	Regulatory Subsidy
<b>Example</b>	Sr. mgmt wants subsidy to attract drivers 65+	Regulatory constraint requires subsidy of drivers 65+
<b>Result of refitting with constraint</b>	Correlated factors will adjust to partially make up for the difference. For example, territories with retirement communities will increase.	
<b>Potential action</b>	Do not refit models with constraint	Consider implication of refitting and make a business decision
