

**Incorporating Reinsurance Considerations**  
Product design using an augmented price optimization framework

---

---

**Agenda**

- Introduction
  - Reinsurance considerations in product design – current approaches
  - Limitations
- A price optimization approach
  - Price Optimization 101
  - Adding reinsurance considerations - conceptual implications
- Practical challenges
  - Data
  - Modeling
  - Bringing models together
  - Communication (Building management information systems and dashboards)

---

---

---

---

---

---

---

---

---

**Reinsurance considerations in primary product design – current approaches**

- Let's define product design
- Structure
- Underwriting
- Pricing

---

---

---

---

---

---

---

---

---

---

**Reinsurance considerations in primary product design – limitations to current approaches**

- A rough estimate of profitability
- A disjointed approach

---

---

---

---

---

---

---

---

**Price Optimization 101**

- Integration
  - Losses
  - Demand
  - Premiums
  - Expenses

---

---

---

---

---

---

---

---

**Price Optimization 101**

- Components are a function of premium
  - Assuming all else is fixed

---

---

---

---

---

---

---

---

### Price Optimization 101

- Overlay with competitive information

Underwriting profit      Competitiveness

© 2013 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only.

---

---

---

---

---

---

---

---

### Price Optimization 101

- Scenario-testing
  - Testing alternative premium propositions
  - A manual process
  - Add time and you have a Customer Lifetime Value framework

© 2013 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only.

---

---

---

---

---

---

---

---

### Price Optimization 101

- Simulations
  - To industrialize this scenario-testing
  - Consider range of possible premiums around current premium
  - We just created a universe to search through
    - Millions of possible combinations (at portfolio level)
  - Some will be inferior to others

© 2013 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only.

---

---

---

---

---

---

---

---

### Price Optimization 101

- Optimization
  - At portfolio level
  - Searches the universe of portfolios
  - Identifies best outcome of one metric (e.g. profit) given value of another metric (e.g. volume)
  - Said differently: Identifies best trade-offs btw profit and volume

---

---

---

---

---

---

---

---

---

---

---

---

### Price Optimization 101

- The search space will contain scenarios you would like to test
  - So, you can situate your scenarios and see how close they are to the frontier
- Next phase is to
  - pick a point
  - adjust your rating algorithm
- Other comments
  - Alternative measures can be used (dislocation, cross-subsidies, etc.)
  - Time dimension
  - CLV

---

---

---

---

---

---

---

---

---

---

---

---

### Price Optimization 101

- Example outputs
  - One dimension
  - Two dimension

---

---

---

---

---

---

---

---

---

---

---

---

### Price Optimization 101 – Summary

- One lever: premium
- Steps
  - Integration
  - Scenario-testing
  - Simulations
  - Price Optimization
- Technically this is all "optimization"
  - With varying degrees of sophistication

© 2013 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only.

---

---

---

---

---

---

---

---

---

---

### A Price Optimization Approach (with Reinsurance)

- Let us assume a non-simple reinsurance program
- Steps
  - Integration
  - Scenario-testing
  - Price Simulations
  - Price Optimization

© 2013 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only.

---

---

---

---

---

---

---

---

---

---

### Integration

- Components
  - Losses
  - Demand
  - Premiums
  - Expenses
  - Ceded Losses
  - Reinsurance Cost

**Reinsurance Profit = + Ceded AAL - Reinsurance cost**

**Net Profit = + Premium - Attritional Losses - Expenses + Reinsurance Profit**

© 2013 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only.

---

---

---

---

---

---

---

---

---

---

**Output**

- Quantify impact of reinsurance on profitability
- Estimate of performance including reinsurance
  - Very useful where reinsurance is a large component of BS and P&L
    - Cat-exposed business (Florida, severe convective storms, etc.)
    - Low frequency / high severity risks
  - Identify those policies driving up reinsurance cost but not contributing to overall profit
- Circle back into underwriting at individual risk level
  - Underwriting
  - Price changes
  - Cross-subsidies

© 2013 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only.

---

---

---

---

---

---

---

---

**Output**

- A finer estimate of profitability

Average Retained Annual Loss to Premium Ratio      Underwriting Profit to Premium Ratio

Legend: Low (blue), Medium (green), High (red)

© 2013 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only.

---

---

---

---

---

---

---

---

**Output**

- Impact of reinsurance

Gross Profit      Net Profit

Legend: Low (blue), Medium (green), High (red)

© 2013 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only.

---

---

---

---

---

---

---

---

### Scenario Testing

- Test alternative premium propositions
  - Assuming fixed reinsurance
- Test alternative reinsurance
  - Assuming fixed premiums
  - Or optimize premiums under each scenario

The flowchart illustrates the financial flow from premium and demand to expected profit. Premium and Demand are inputs to Gross Profit. Losses and Expenses are subtracted from Premium to reach Gross Profit. Gross Profit is then reduced by Ceded Losses and Reinsurance Profit (from the Reinsurance Programme) to reach Net Profit. Finally, Net Profit is used to determine Expected Profit. Reinsurance Programme also influences Ceded Losses and RI cost.

---

---

---

---

---

---

---

---

---

---

### Scenario Testing

- How would the frontier change (conceptually)
  - Change in RoL = Translation
  - Change in limit = Translation

The Efficient Frontier graph plots Profit (\$M) on the y-axis (ranging from -10 to 15) against Win Rate on the x-axis (ranging from 0.32 to 0.66). Two lines are shown: a yellow line for Gross profit and a red line for Net profit. Both lines show a downward trend as the win rate increases, with the Net profit line consistently below the Gross profit line.

---

---

---

---

---

---

---

---

---

---

### Scenario Testing

- How to design reinsurance program more efficiently
  - Increase the reinsurance profit
  - Sensitivity test layers
  - Compare RI cost with impact on PMLs and see if effective (cost/benefit analysis)
  - Cost changes across layers
- Circle back into underwriting
  - Underwriting
  - Price changes
  - Cross-subsidies
- Overlay with competitor data
  - Simulate price change scenarios
  - Price sensitivity tells you who will react to rate increases/decreases (and how strongly)

---

---

---

---

---

---

---

---

---

---

**Simulations**

- Is Reinsurance profit dynamic or static?
  - Ceded Losses
    - Depend on reinsurance terms
    - Depend on risk profile
  - Reinsurance Cost
    - Depends on premium (proportional RI)
    - Does not depend on premium (for XoL)
- Reinsurance terms is not a simple function of anything
  - Unlike premiums and gross expected profit
  - For XoL: use the highest layer limit?
    - This could be a two-dimensional optimization

---

---

---

---

---

---

---

---

---

---

---

---

**Learnings**

- To do optimization you need
  - To identify what your levers are
  - Them to be at policy level
- Reinsurance
  - Book level
  - Scenario testing
- At individual level
  - Premiums
  - Additional services
- Policy allocation methodology will impact optimization results

---

---

---

---

---

---

---

---

---

---

---

---

**Practical challenges**

- Typical challenges are
  - Data
  - Modeling
  - Resources
  - Integration
  - Communication
- They apply irrespective of complexity of existing Optimization

© 2013 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only.

---

---

---

---

---

---

---

---

**Practical challenges - Data**

- Manage multiple sources
  - Underwriting, Reinsurance, Actuarial information
- Needed:
  - Policy information (claims, policy characteristics)
  - Loss cost estimate
  - Competitive information
  - Detail of reinsurance conditions (programme, RoLs)
  - If "predictive underwriting": live integration to quotation systems
- At different points in time
  - Current
  - Next year
  - Future years

© 2013 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only.

---

---

---

---

---

---

---

---

**Practical challenges - Modeling**

- Models needed:
  - Loss cost models
  - Policyholder behavior models
  - Estimate of ceded claims
    - In aggregate – e.g. cat model output (risk location, TIVs)
    - Policy by policy and policy-level attribution of aggregate metrics
    - Reinsurance layer exhaustion
- Resources
  - Software
  - Knowledge
  - Cooperation / internal buy-in

© 2013 Towers Watson. All rights reserved. Proprietary and Confidential. For Towers Watson and Towers Watson client use only.

---

---

---

---

---

---

---

---

**Practical challenges - Integration**

- Data
- Systems/software
- Ideally as smooth as possible
- A process which is
  - Repeatable and easily updatable : Productivity gains
  - Adaptable: where individual components can be enhanced/replaced
- For optimization
  - Methodology
  - Tools supporting the methodology
  - Software

---

---

---

---

---

---

---

---

---

---

**Practical challenges - Communication**

- Building management information systems and dashboards
- It's a complex analysis – how quickly can you run it again?
