

# **Antitrust Notice**

- The Casualty Actuarial Society is committed to adhering strictly to the letter and spirit of the antitrust laws. Seminars conducted under the auspices of the CAS are designed solely to provide a forum for the expression of various points of view on topics described in the programs or agendas for such meetings.
- Under no circumstances shall CAS seminars be used as a means for competing companies or firms to reach any understanding – expressed or implied – that restricts competition or in any way impairs the ability of members to exercise independent business judgment regarding matters affecting competition.
- It is the responsibility of all seminar participants to be aware of antitrust regulations, to prevent any written or verbal discussions that appear to violate these laws, and to adhere in every respect to the CAS antitrust compliance policy.

 Goal should be to build best predictive models now and incorporate constraints later

#### Initial modeling

014 Towers Watson. All rights

- · Initial modeling is done to test basic modeling methodology
- Is my link function appropriate?
- Is my error structure appropriate?
- Is my overall modeling methodology appropriate (e.g. do I need to cap losses? Exclude expense only claims? Model by peril?)

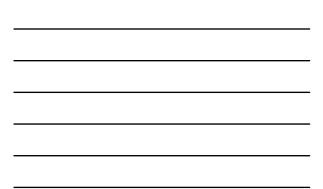

## Generally accepted error structure and link functions

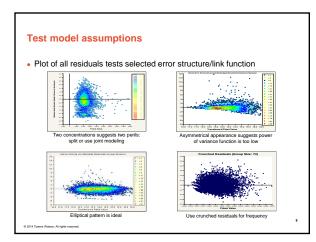

Use generally accepted standards as starting point for link functions and error structures

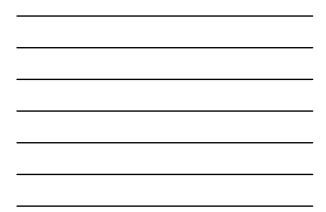

Observed Response	Most Appropriate Link Function	Most Appropriate Error Structure	Variance Function
-	-	Normal	μ <sup>0</sup>
Claim Frequency	Log	Poisson	μ1
Claim Severity	Log	Gamma	μ²
Claim Severity	Log	Inverse Gaussian	µ <sup>3</sup>
Pure Premium	Log	Gamma or Tweedie	μ <sup>τ</sup>
Retention Rate	Logit	Binomial	μ(1-μ)
Conversion Rate	Logit	Binomial	μ(1-μ)

#### Build an initial model

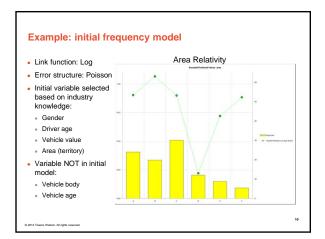

- Reasonable starting points for model structure
- Prior model
- Stepwise regressionGeneral insurance knowledge
- · CART (Classification and Regression Trees) or similar algorithms

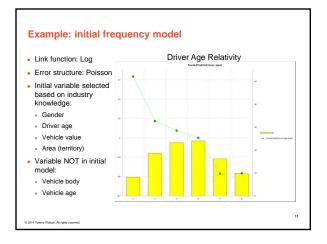

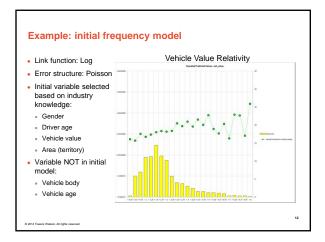

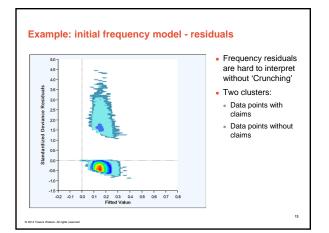

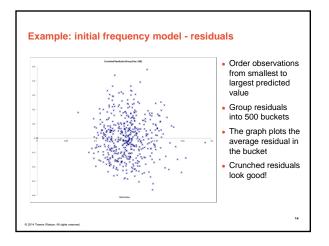

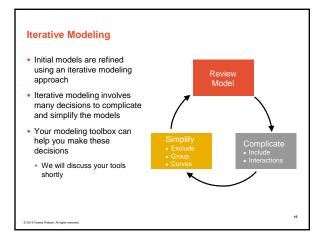

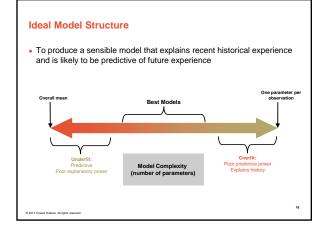

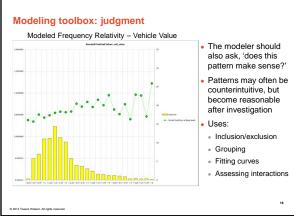

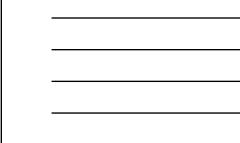

## Your modeling tool box

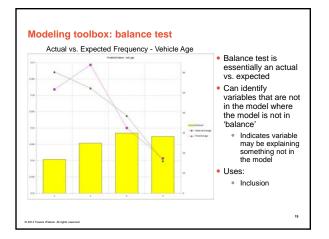

- Model decisions include:
- Simplification: excluding variables, grouping levels, fitting curves
- Complication: including variables, adding interactions
- Your modeling toolbox will help you make these decisions

17

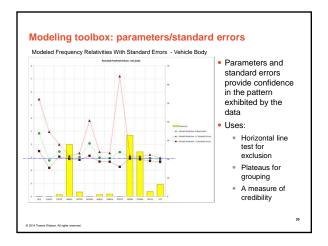

- Your tools include:
  - Parameters/standard errors
- Consistency of patterns over time or random data sets
- Type III statistical tests (e.g., chi-square tests, F-tests)
- Balance tests (i.e. actual vs. expected test)
- Judgment (e.g., do the trends make sense?)

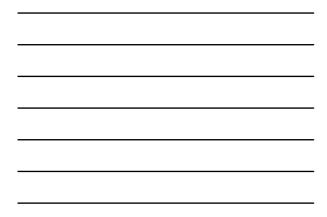

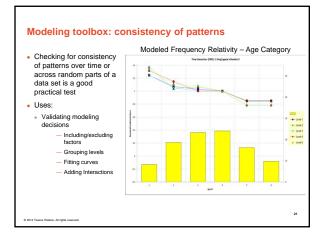

## Modeling toolbox: type III tests

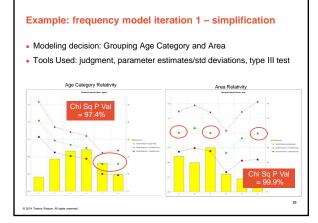

- Chi test and/or F-Test is a good statistical test to compare nested models • H<sub>o</sub>: Two models are essentially the same
- H<sub>1</sub>: Two models are not the same
- Principle of parsimony: If two models are the same, choose the simpler model

22

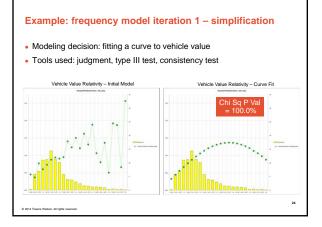

#### • Uses: Inclusion/exclusion

014 Towers Watson. All rights

Chi-Square Percentage	Meaning	Action*
<5%	Reject H <sub>o</sub>	Use More Complex Model
5%-15%	Grey Area	???
15%-30%	Grey Area	???
>30%	Accept H <sub>o</sub>	Use Simpler Model

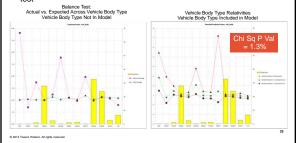

## Example: frequency model iteration 2 – complication

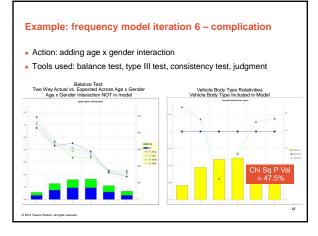

- Modeling decision: adding vehicle body type
- Tools used: balance test, parameter estimates/std deviations, type III test

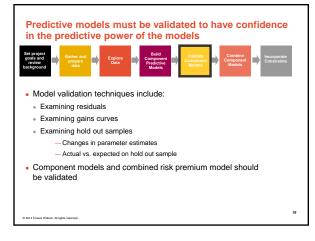

26

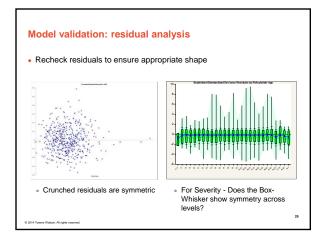

## Example: iterative modeling continued....

- Iteration 3 simplification
- Group vehicle body type
- Iteration 4 complication
- Add vehicle age
- Iteration 5 simplification
- group vehicle age levels

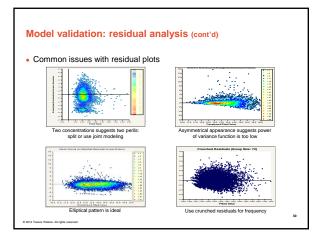

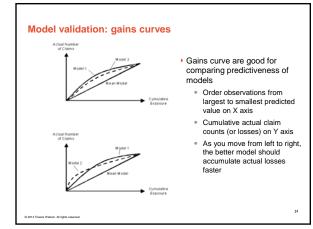

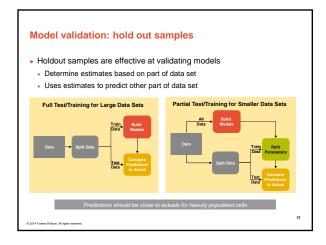

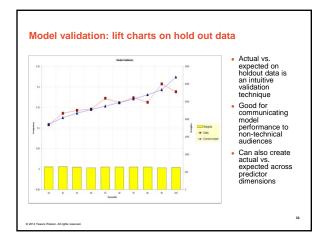

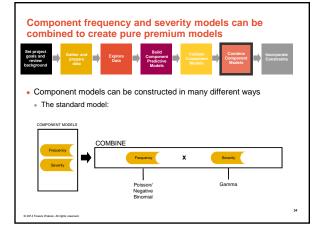

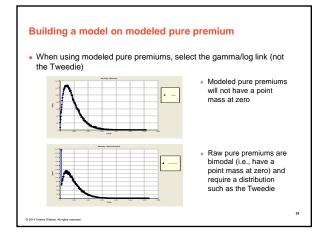

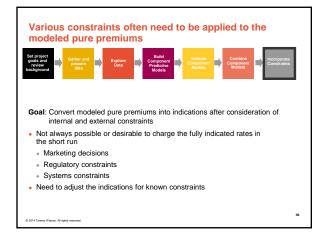

## Constraints to give desired subsidies

- Offsetting one predictor changes parameters of other correlated
  predictors to make up for the restrictions
- . The stronger the exposure correlation, the more that can be made up through the other variable
- Consequently, the modeler should not refit models when a desired subsidy is incorporated into the rating plan

	Insurer-Desired Subsidy	Regulatory Subsidy	
Example	Sr. mgmt wants subsidy to attract drivers 65+	Regulatory constraint requires subsidy of drivers 65+	
Result of refitting with constraint	Correlated factors will adjust to partially make up for the difference. For example, territories with retirement communities will increase.		
Potential action	Do not refit models with constraint	Consider implication of refitting and make a business decision	
	constraint	de
