Concluding
Remarks

- An endorsement, or a rider,
 - provides optional insurance coverage
 - may include alternative deductibles and coverage limits
 - also provides extensions to the type of peril (e.g., stolen jewelry in homeowners insurance) covered
- If there were no charge, it is not optional
- How do we charge for an endorsement in a generalized linear model setting?
 - 1 Endorsements form a relatively small fraction of the premium base and so only informal, ad hoc, approaches are needed.
 - 2 Use information from an external agency for this set of relativities
 - 3 Treat endorsements as another type of coverage and use GLM techniques to determine this set of prices.
 - Requires a substantial amount of data
 - Requires claims that are identified by type of endorsement.

Local Government Property Insurance Fund

Performance

Concluding
Remarks

- We seek other alternatives
- Local Government Property Insurance Fund (LGPIF)
 - was established to provide property insurance for local government entities that include counties, cities, towns, villages, school districts, and library boards.
 - covers over a thousand local government entities who pay approximately \$25 million in premiums each year and receive insurance coverage of about \$75 billion.
 - offers three major groups of insurance coverage: building and contents (BC), inland marine (construction equipment), and motor vehicles.
 - acts as a stand-alone insurance company, charging premiums to each local government entity (policyholder) and paying claims when appropriate.
 - not permitted to deny coverage for local government entities. Thus, the LGPIF acts as a “residual” market to a certain extent

Concluding
Remarks

- Because of the size of the fund, there will be little difficulties using GLM to determine relativities/rates for the basic variables
- Endorsements are more difficult
 - 1 Fund is undergoing a major rate restructuring, politically sensitive
 - 2 Information from external agencies is expensive and not particularly relevant
 - 3 LGPIF data for optional coverages is limited
- We employed GLM techniques with restrictions on the coefficients through shrinkage using well-known penalized likelihood methods. Advantages:
 - 1 We provide relativities for endorsements in a disciplined manner, mitigating ad hoc adjustments
 - 2 Because we use GLM techniques, our approach is naturally multivariate and the introduction of endorsements accounts for the presence of other rating variables.

Building and Contents Claims Summary

Rating
Endorsements
using
Generalized
Linear Models
Frees

- Number of policyholders is declining yet coverage is steady

Year	Average Frequency	Average Severity	Average Coverage	Number of Policyholders
2006	1.015	17,729	32,498,186	1,154
2007	1.235	15,158	35,275,949	1,138
2008	1.041	10,728	37,267,485	1,125
2009	1.277	9,934	40,355,382	1,112
2010	1.285	33,026	41,242,070	1,110
2011	1.036	20,554	42,503,989	1,094

- Going forward, 2006–2010 is for training, 2011 is for validation

Concluding
Remarks

Variable	Description
EntityType	Categorical variable that is one of six types: (Village, City, County, Misc, School, or Town)
LnCoverage	Total building and content coverage, in logarithmic millions of dollars
LnDeduct	Deductible, in logarithmic dollars
NoClaimCredit	Binary variable to indicate no claims in the past two years
Fire5	Binary variable to indicate the fire class is below 5 (The range of fire class is 0 ~ 10)

Rating Variables

Endorsements

Claims Modeling

Results from the
Claims Modeling

Out of Sample
Performance

Concluding
Remarks

Variable	Number of Policies	Average Frequency	Average Claim
EntityType			
Village	1,341	0.529	11,869.75
City	793	2.042	39,177.27
County	328	4.973	95,832.87
Misc	609	0.204	40,011.89
School	1,597	1.500	70,606.31
Town	971	0.118	18,449.46
Fire5-No	2,508	0.563	18,346.54
Fire5-Yes	3,131	1.655	68,798.51
NoClaimCredit-No	3,786	1.571	53,283.61
NoClaimCredit-Yes	1,853	0.349	32,666.54
Total	5,639	1.169	49,358.53

- There is substantial variation in the claims distribution by each rating variable
- By itself, `Fire5` is counter-intuitive. We anticipate lower claims when the fire class is below 5 (`Fire5=Yes`)

Variable	Description
Business Interruption	Reimburses an insured for business interruption (lost profits and continuing fixed expenses)
Accounts Receivable	Adds coverage for money owed by its debtors during business interruption due to a covered loss.
Pier and Wharf	Loss of watercraft, by the pressure of ice or water on piers and wharves
Fine Arts	Adds coverage (agreed value) on fine arts, either per item or per exhibit
Golf Course Grounds	Adds coverage to golf course type property such as greens, tees, fairways, etc.
Special Use Animal	Adds coverage for police enforcement animals, such as dogs and horses
Zoo Animals	Adds coverage for zoo animals. Animal mortality is specifically excluded.
Vacancy Permit	Allows claims from covered losses arising from vacant property
Monies and Securities	Adds coverage for monies and securities for loss by theft, disappearance, or destruction (A: loss inside premise, B: loss outside premise).
Other Endorsements	Other additional endorsements, including ordinance & law, and extra expenses

Introduction

LGPIF Data

Fund Claims and
Rating Variables
Endorsements

Claims Modeling

Results from the
Claims Modeling

Out of Sample
Performance

Concluding
Remarks

- Begin with classic linear model shrinkage estimation, minimize

$$\sum_{i=1}^n \left(y_i - \beta_0 - \sum_{j=1}^k x_{ij} \beta_j \right)^2 + \lambda \sum_{j=1}^k \beta_j^2.$$

- Values of λ control the complexity of the model; smaller values mean less shrinkage
- Can write this in terms of classical “ridge regression”

$$\hat{\beta}_{shrink} = (\mathbf{X}'\mathbf{X} + \lambda\mathbf{I})^{-1} \mathbf{X}'\mathbf{y}$$

- appealing in instances of collinearity
- For (nonlinear) GLMs, we use a penalized likelihood of the form

$$l(\beta) = \sum_{i=1}^n \log f(y_i) - \lambda \|\mathbf{R}\beta - \mathbf{r}\|^2,$$

- We used the offset variable

$$\text{offset} = \ln(0.95)AC05 + \ln(0.90)AC10 + \ln(0.85)AC15.$$

- AC05 represents a binary variable to indicate the presence of a 5% alarm system (meaning that automatic smoke alarms exist in some of the main rooms)
- similarly for AC10 and AC15
- Also included an offset for vacancy permits

LGPIF Data

Fund Claims and
Rating Variables
Endorsements

Claims Modeling

Results from the
Claims Modeling

Out of Sample
Performance

Concluding
Remarks

- Summary statistics suggest that *endorsement coverage amount* may influence claims outcomes
- To capture this, using GLMs

- y_B represents claims from a base coverage, mean $\mu_B = \exp(\mathbf{x}'\beta)$
- Let y_E be the claims from an endorsement, mean μ_E .

$$\mu = E y = \begin{cases} \mu_B = \exp(\mathbf{x}'\beta) & \text{endorsement not present} \\ \mu_B + \mu_E = \exp(\mathbf{x}'\beta + \beta_E x_E) & \text{endorsement present} \end{cases}$$

- Let $Coverage_E$ and $Coverage_B$ represent amount of coverage for the endorsement and base (building and contents)
- Define

$$x_E = \ln \left(1 + \frac{Coverage_E}{Coverage_B} \right).$$

- We will use x_E in our GLM specifications

Endorsements

- Base mean $\mu_B = \exp(\mathbf{x}'\beta)$, Endorsement mean μ_E .

$$\mu = E y = \begin{cases} \mu_B = \exp(\mathbf{x}'\beta) & \text{endorsement not present} \\ \mu_B + \mu_E = \exp(\mathbf{x}'\beta + \beta_E x_E) & \text{endorsement present} \end{cases}$$

$$x_E = \ln \left(1 + \frac{\text{Coverage}_E}{\text{Coverage}_B} \right).$$

- With this specification, we have

$$\begin{aligned} \mu_E &= \exp(\mathbf{x}'\beta + \beta_E x_E) - \mu_B \\ &= \mu_B \left[\left(1 + \frac{\text{Coverage}_E}{\text{Coverage}_B} \right)^{\beta_E} - 1 \right] \\ &\approx \mu_B \left[\left(1 + \beta_E \frac{\text{Coverage}_E}{\text{Coverage}_B} \right) - 1 \right] \\ &= \beta_E \times \text{Coverage}_E \times \left(\frac{\mu_B}{\text{Coverage}_B} \right), \end{aligned}$$

using the approximation $(1+z)^b \approx 1+bz$.

- Endorsement Price μ_E is a factor times the endorsement coverage, rescaled by the overall cost per unit coverage. The factor, β_E , is estimated from the data.

Concluding
Remarks

- 1 Detailed analysis of the Wisconsin Local Government Property Insurance Fund.
 - There is little in the literature on government property and casualty actuarial applications.
 - The LGPIF is similar to small commercial property insurance, making our work of interest to a broad readership.
- 2 Detailed analysis in the manner of a case study so that other analysts may replicate parts of our approach.
 - We provide relativities not only for our primary rating variables but also for endorsements.
 - Introduce an approach for handling these optional coverages when it is not known whether or not a claim is due to an endorsement.

Concluding
Remarks

- 1 Detailed analysis of the Wisconsin Local Government Property Insurance Fund.
- 2 Detailed analysis in the manner of a case study so that other analysts may replicate parts of our approach.
- 3 Explored the use of shrinkage estimation in ratemaking
 - Shrinkage is particularly appealing in the case of endorsements.
 - Little predictive ability was lost by using shrinkage methods and they gave much more intuitively appealing relativities.
 - Helpful to have relativities that can be calibrated in a disciplined manner and are consistent with sound economic, risk management, and actuarial practice.
