CAS Spring Meeting - Session C22
Technical Provisions in Solvency II
What EU Insurers Could Do with Schedule P

Glenn Meyers
FCAS, MAAA, Ph.D.
Vice President – Research
ISO Innovative Analytics

May 24, 2010

DATA • ANALYTICS • DECISION SUPPORT

ISO Innovative Analytics

ISO

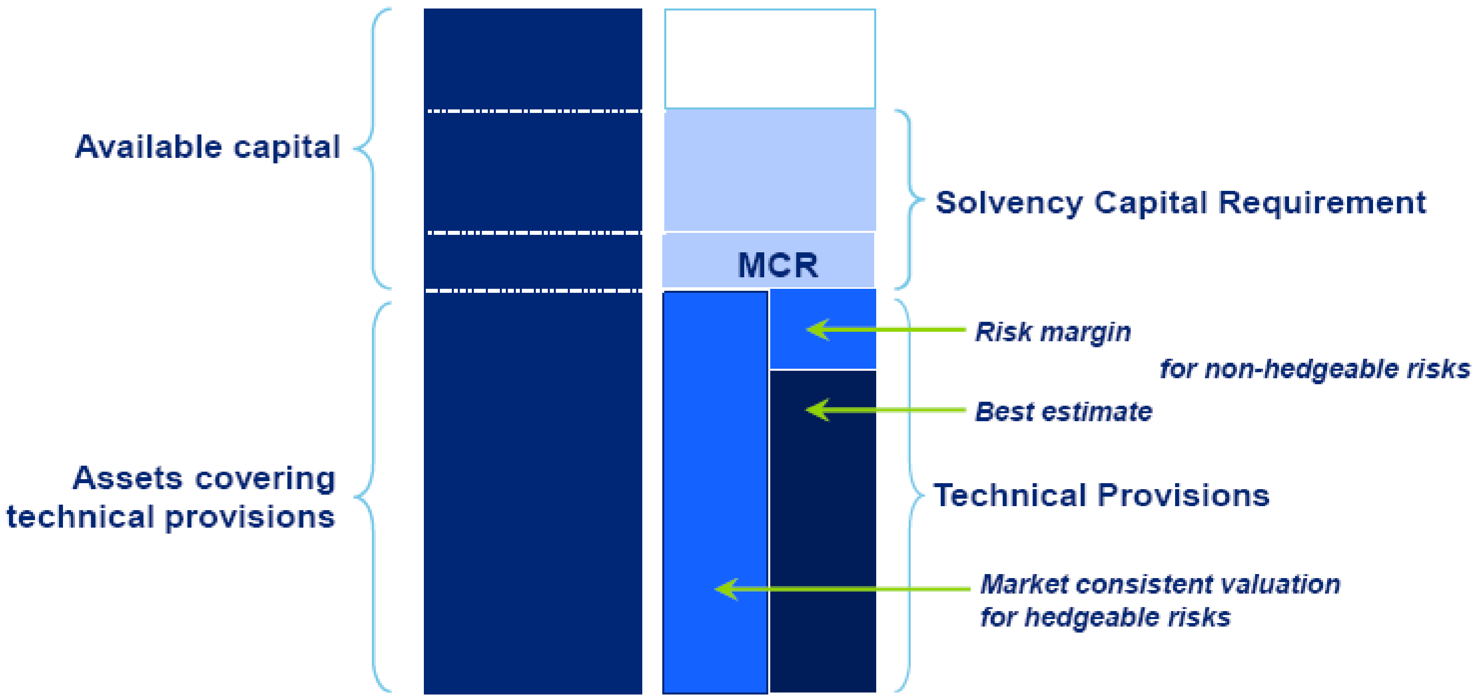
Outline of Presentation

- **Technical Provisions in Solvency II**
  – As described in the EU Framework Directive
- **American NAIC Schedule P Loss Triangles**
- **How to use data in Schedule P**
  – Calculate best estimate
  – Calculate risk margin (Market Value Margin)

Background

- **Solvency II adopted by European Parliaments**
  - Effective October 31, 2012
- **Objectives include:**
  - Increased focus on effective risk management, control and governance
  - Market consistent valuation of assets & liabilities
  - Increased disclosure and transparency

Focus of Presentation
Technical Provisions



Conceptually in line with IFRS

Principles Underlying Technical Provisions Described in Articles 76-83 of EU Framework Directive

EUROPEAN UNION

THE EUROPEAN PARLIAMENT	THE COUNCIL
	Brussels, 19 October 2009 (OR. en)
2007/0143 (COD)	PE-CONS 3643/1/09 REV 1
	SURE 15 ECOFIN 349 CODEC 693

LEGISLATIVE ACTS AND OTHER INSTRUMENTS

Subject:	DIRECTIVE OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL on the taking-up and pursuit of the business of Insurance and Reinsurance (Solvency II) (recast)

Clip from Article 77
Calculation of technical provisions

1. The value of technical provisions shall be equal to the sum of a best estimate and a risk margin as set out in paragraphs 2 and 3.

2. The best estimate shall correspond to the probability-weighted average of future cash-flows, taking account of the time value of money (expected present value of future cash-flows), using the relevant risk-free interest rate term structure.

- - - - - - - - - -

The best estimate shall be calculated gross, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles. Those amounts shall be calculated separately, in accordance with Article 81.

Clip from Article 77
Calculation of technical provisions

4. Insurance and reinsurance undertakings shall value the best estimate and the risk margin separately.

\- - - - - - - - - - -

5. Where insurance and reinsurance undertakings value the best estimate and the risk margin separately, the risk margin shall be calculated by determining the cost of providing an amount of eligible own funds equal to the Solvency Capital Requirement necessary to support the insurance and reinsurance obligations over the lifetime thereof.

Clip from Article 80
Segmentation

Insurance and reinsurance undertakings shall segment their insurance and reinsurance obligations into homogeneous risk groups, and as a minimum by lines of business, when calculating their technical provisions.

Schedule P Loss Triangles

- **Part of American NAIC Annual Statement**
  - All American insurers must submit to regulators
  - Data is available to the public
    - At a price (academic discounts available)
    - http://www.naic.org/store_financial_home.htm
  - Multiples lines of business
  - Paid and incurred loss triangles

Amounts in Thousands

Using Schedule P Data

- **We of course have the reported earned premium and incremental paid loss**
- **But we also have similar data for every American insurer for each line of business**
  - ***A great source of "prior information" that can be used in a Bayesian analysis***
  - Use Schedule P data for large insurers to create 5000 "benchmark scenarios" for each line of insurance

ISO

Loss Model

- Expected Loss

$$\mu_{AY,Lag} = Premium_{AY} \cdot ELR_{AY} \cdot Dev_{Lag} \cdot t^{AY+Lag-1}$$

- Variance of Loss

$$Var\left[X_{AY,Lag}\right] = \mu_{AY,Lag} \cdot \tau_{Lag} \cdot \left(1 + 1/\alpha\right) + c \cdot \mu_{AY,Lag}^2$$

$$\tau_{Lag} = Sev \cdot \left(1 - \left(1 - \frac{Lag}{10}\right)^3\right) \text{ for } Lag = 1,2 \ldots,10.$$

- $\{ELR_{AY}\}$,$\{Dev_{Lag}\}$, *t*, *c*, and *Sev* are unknown parameters,

Tweedie Model of Losses in Each (*AY,Lag*) Cell

$$\mu_{AY,Lag} = Premium_{AY} \cdot ELR_{AY} \cdot Dev_{Lag} \cdot t^{AY+Lag-1}, p = \frac{\alpha+2}{\alpha+1}$$

$$\phi_{AY,Lag} \cdot \mu^{p}_{AY,Lag} = \mu_{AY,Lag} \cdot \tau_{Lag} \cdot (1+1/\alpha) + c \cdot \mu^{2}_{AY,Lag}$$

- Pick a parameter set $\{ELR_{AY}\}$, $\{Dev_{Lag}\}$, t, c, *Sev*
- Translate parameters into Tweedie parameters
  - $\mu_{AY,Lag}$, p and $\phi_{AY,Lag}$
- Calculate sample parameter sets from posterior distribution with Metropolis-Hastings Algorithm
  - See Session C3 – Tomorrow
  - Keep 500 Parameter Sets

Sample from Metropolis-Hastings Algorithm Applied to $\{Dev_{Lag}\}$ and $\{ELR_{AY}\}$ parameters

Calculating the Best Estimate
From Article 77 – Framework Directive

2. The best estimate shall correspond to the probability-weighted average of future cash-flows, taking account of the time value of money (expected present value of future cash-flows), using the relevant risk-free interest rate term structure.

- Expected loss for n^{th} Metropolis-Hastings scenario

$$\mu_{n,AY,Lag} = Premium_{AY} \cdot ELR_{AY} \cdot Dev_{Lag} \cdot t^{AY+Lag-1}$$

- Best Estimate i = 4%

$$\sum_{AY=2}^{10} \sum_{Lag=12-AY}^{10} \left(\frac{1}{500} \sum_{n=1}^{500} \mu_{n,AY,Lag} \right) \cdot \frac{1}{(1+i)^{AY+Lag-11.5}} = 91{,}220$$

Technical Provisions, Risk Margins and the IAA

- International Association of Insurance Supervisors (IAIS) requested help from the International Actuarial Association (IAA) to work on the issues of risk based capital and risk margins for loss reserves.
- Available on IIA Website
  http://www.actuaries.org/LIBRARY/Papers/IAA_Measurement_of_Liabilities_2009-public.pdf
- Refer to risk margin as Market Value Margin (MVM)

IAIS – Properties of Risk Margins

1. The less that is known about the current estimate and its trend; the higher the risk margins should be.
2. Risks with low frequency and high severity will have higher risk margins than risks with high frequency and low severity.
3. For similar risks, contracts that persist over a longer timeframe will have higher risk margins than those of shorter duration.
4. Risks with a wide probability distribution will have higher risk margins than those risks with a narrower distribution.
5. To the extent that emerging experience reduces uncertainty, risk margins will decrease, and vice versa.

Possibilities

- **Undiscounted reserves**
  - Only satisfy Property 3
- **Percentile method**
  - Does not satisfy Property 3
- **Cost of Capital Method**
  - Satisfies all properties
- **So – What is the Cost of Capital Method?**

What is Capital?

- **Sufficient for time horizon of one year**
  - Controversial – Many prefer a longer time horizon
- **Capital = TVaR@99% – Expected Loss**
  - Calculate for each future payment year
    - i.e. sub diagonal
  - Remember the time value of money
- **FFT methods on Tweedie distributions allow for reliable calculation of TVaR**

Predictive Distribution of Reserve Outcomes – 1 Year

$$R_1 = \sum_{AY=2}^{10} X_{AY,12-AY}$$

Predictive Distribution of Reserve Outcomes – 10 Year

$$R_{10} = \sum_{AY=2}^{10} \sum_{Lag=12-AY}^{10} X_{AY,Lag}$$

ISO

Statistics of Interest for Risk Margins Predictive Distributions of Reserve Outcomes

- Simulation
  - Randomly select $\{ELR_i\}$,$\{Dev_j\}$, t, c, Sev from the posterior
  - Simulate $R_{10} = \sum_{AY=2}^{10} \sum_{Lag=12-AY}^{10} X_{AY,Lag}$ where $X_{AY,Lag}$ ~ Tweedie
- Simulate R_1 Similarly
- Use the Fast Fourier Transform
  - Faster, more accurate, but uses some math

Explanation of C_t Calculation (Documentation)

(1) The time, t, after the liability is set.

(2) The expected value of all future payments, $L_t^{Nom} = \sum_{AY=2+t}^{10} \sum_{Lag=12+t-AY}^{10} \mu_{AY,Lag}$.

(3) $\Delta L_t^{Nom} = L_t^{Nom} - L_{t+1}^{Nom}$.

(4) The discounted liability, $L_t^{Disc} = \sum_{k=t}^{8} \frac{\Delta L_k^{Nom}}{(1+i)^{k-t+0.5}}$.

(5) The Tail-Value-at-Risk, i.e., the conditional expected value of the random loss,

$\sum_{AY=2+t}^{10} \sum_{Lag=12+t-AY}^{10} X_{AY,Lag}$, given that the loss exceeds the 99th percentile.

(6) $\Delta \text{TVaR}_t^{Nom} = \text{TVaR}_t^{Nom} - \text{TVaR}_{t+1}^{Nom}$.

(7) The discounted $\text{TVaR}_t^{Disc} = \sum_{k=t}^{8} \frac{\Delta \text{TVaR}_k^{Nom}}{(1+i)^{k-t+0.5}}$.

(8) The needed capital at time t is expected to be $C_t = \text{TVaR}_t^{Disc} - L_t^{Disc}$.

ISO

Risk Margin Version 1 – Capital Cash Flow (CCF)

- **C_t = required capital at time *t* for one year.**
  - TVaR@99% - Expected Loss   (discounted)
- ***i*   = risk-free rate of return**
- ***r* = risky rate of return due to insurer's investors**
- **$MVM_{CCF} = C_0$ – PV(Released Capital @ rate *r*)**

$$MVM_{CCF} = C_0 - \sum_{t=0}^{\infty} \frac{C_t \cdot (1+i) - C_{t+1}}{(1+r)^{t+1}}$$

$$MVM_{CCF} = (r-i) \cdot \sum_{t=0}^{\infty} \frac{C_t}{(1+r)^{t+1}}$$

After some algebra

Versions 2 and 3

- **Capital Cash Flow (CCF)**

$$MVM_{CCF} = (r - i) \cdot \sum_{t=0}^{\infty} \frac{C_t}{(1 + r)^{t+1}}$$

- **Swiss Solvency Test (SST)**
  - Starts at t = 1. Ignores capital raised in first year.
  - Discounts at rate i instead of rate r.

$$MVM_{SST} = (r - i) \cdot \sum_{t=1}^{\infty} \frac{C_t}{(1 + i)^{t+1}}$$

- **Solvency II/QIS4 (SII)**
  - Starts at t = 0

$$MVM_{SII} = (r - i) \cdot \sum_{t=0}^{\infty} \frac{C_t}{(1 + i)^{t+1}}$$

All three versions satisfy the IAIS criteria.

ISO

Rationale Behind MVM_{SST}

$$MVM_{SST} = (r - i) \cdot \sum_{t=1}^{\infty} \frac{C_t}{(1+i)^{t+1}}$$

"The risk margin can be expressed as the expected present value of the cost of capital necessary to buffer the nonhedgeable risk of insurance liabilities during the entire lifetime of the insurance liabilities."

Rationale Behind MVM_{SII}

$$MVM_{SII} = (r - i) \cdot \sum_{t=0}^{\infty} \frac{C_t}{(1+i)^{t+1}}$$

Both Solvency II and SST require capital to cover risk over a one year time horizon. SST says that you don't need a risk margin to cover the first year. Solvency II says you do.

The Results

r = 10% i =4% Best Estimate = 91,220

Time Horizon	MVM_{CCF}	%	MVM_{SST}	%	MVM_{QIS4}	%
1	1,994	2.2%	1,854	2.0%	2,411	2.6%
10	5,082	5.6%	4,736	5.2%	6,129	6.7%

Summary

- **Used Bayesian analysis and likelihood of a triangle of data based on the Tweedie model to calculate posterior probabilities of scenarios**
- **Used posterior probability of scenarios to calculate**
  - Current Estimate
  - Risk margin
